**Mr. T. Arnold, F.R.I.B.A.**, read a paper on "Celtic Art" at the meeting of the Gaelic Society of London, on Wednesday.

**Mr. J. Donovan Adam** has been elected an Associate of the Royal Scottish Academy.

**An Art Union** in connection with the Glasgow Institute of the Fine Arts has been formed with the view of promoting interest in art throughout all sections of the community. Mr. Robert Walker, the secretary of the Institute, will act as secretary.

**Mr. G. L. Gomme, F.S.A.**, will deliver an address on "Some Archaic Types of Society in Scotland" at the annual meeting of the Glasgow Archaeological Society on the 20th inst.

**The Glasgow Art Club** have elected the following members:—Mr. Alexander Roche, Mr. John Carlaw, Mr. William Kennedy, Mr. Hamilton Maxwell, and Mr. G. F. Henry.

**Mr. T. Stuart Burnett, A.R.S.A.**, has completed a full-length statue in marble of Rob Roy, the Highland chieftain, which was commissioned for a house in Hyde Park Terrace.

**Mr. Brock, A.R.A.**, has received a commission for a colossal bronze statue of the late Sir Erasmus Wilson, to be erected outside the Margate Infirmary.

**The Council of the British Association** have decided to hold the meeting in 1886 at Birmingham. The claim of Manchester was withdrawn in favour of that town.

**The Town of Mossley** has applied for a charter of Incorporation. At the inquiry of the Local Government Board it was stated that since 1863 the population had risen from 7,000 to about 15,000; the number of inhabited houses in the same period had increased from 1,450 to 3,032, and the rateable value from 22,000*l*. to 50,408*l*.

**Dumfries Prison**, which is one of the most substantial buildings in the south of Scotland was recently purchased by the Mechanics' Institute at 1,900*l*., but the cost of suggested alterations was so large that it has been resold for 2,050*l*. It is proposed to build a church and hall on the site.

**M. Alphand**, the Director of Works in Paris, has in his report to the Prefect suggested the appointment of a Minister of Health, who would undertake the duties which are entrusted, with many others, to the Minister of Commerce.

**"Macbeth"** has been successfully revived at the Odéon. The designs of the costumes are supposed to have been all derived from drawings in the British Museum. The scenery has been painted by MM. Rubé and Chaperon.

**The Hastings Town Council** have decided to offer 20,000*l*. for the land comprising the East and West Hills, which were likely to be used for building purposes, and containing about 140 acres. Ecclesbourne Glen is, however, not included.

**A Government Hospital**, with a medical school on the plan of Guy's, is proposed for Dublin. Earl Spencer has offered to contribute 5,000*l*. towards the work.

**The Social Democratic Federation** includes in its programme the compulsory construction of healthy artisans' and agricultural labourers' dwellings in proportion to the population, such dwellings to be let at rents to cover the cost of construction and maintenance alone.

**A Course of Free Lectures** on sanitary subjects will be shortly delivered before the Sanitary Assurance Association.

**Mr. Maurice Fitzgerald** has been appointed to the Professorship of Engineering in the Queen's College, Belfast.

**The Ruchill Sawmills**, near Maryhill, which have been standing idle for several years, have been purchased by Messrs. M'Farlane, Burns & Co., of Corn Street, Glasgow.

**Sir Gilbert Greenall** has offered to give 1,000*l*. towards the new schools at Latchford, Warrington, on condition that the remaining 1,500*l*. is contributed.

**"Littlecroft."**—This house, which was illustrated on the 1st inst., was erected by Messrs. Payne, of Emery Down, under the direction of Messrs. Ernest George & Peto.

**Mr. J. C. Prestwich** has received instructions from the Sanitary Commission at Stockport to obtain estimates for the proposed new baths.

**Mr. W. T. Oldrieve**, of H.M. Office of Works, Edinburgh, has been awarded a special prize of 50*l*. by the Executive Committee of the International Forestry Exhibition for his essay upon "Maintaining the Supply of Teak."

**Messrs. Perry & Co.**, of Tredegar Works, Bow, have obtained from H.M. Office of Works the contract for the next 3½ years for the general repairs to all the Palaces, Houses of Parliament, Courts of Justice, Post-offices, and civil buildings generally in the London district.

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, NOVEMBER 15, 1884.

### EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

### TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."

### ADVERTISEMENT SCALE.

**GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.**

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

**TESTIMONIALS.**

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it.

"Yours, &c.

"JAMES WEIR, F.R.I.B.A.

"To Mr. Grundy."

"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools in  
course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public.

"Mr. John Grundy."

## BELL'S ASBESTOS FLOORING FELT.

# BELL'S ASBESTOS.

**BELL'S ASBESTOS AND INDIA-RUBBER WOVEN TAPE AND SHEETING** for making every class of steam and water joint. It can be bent by hand to the form required, without puckering, and is especially useful in making joints of manhole and mudhole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 feet, from  $\frac{1}{2}$ -in. to 3-in. wide, and any thickness from  $\frac{1}{8}$  in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears the trade mark, without which none is genuine; It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at my price, users are recommended to see that every 10-ft. length of the Asbestos Tape purchased by them bears the trade mark.

# The Architect.

## IS ARCHITECTURE WORTH LIVING FOR?

IN the spirited discourse by Mr. J. D. SEDDING which we inserted at full length in last week's *Architect*, the question is asked in so many words—and the answer is manifestly expected to be delivered summarily in the negative—"Is architecture, as practised by the modern (English) architect, worth living for?" Mr. MALLOCK's inquiry whether life itself is worth living for everybody has heard of. This also was answered in the negative; and we all, Mr. MALLOCK included, may be said to have lived ever since under protest. That architecture, as a small and peculiar province of life easily overlooked, might be an exception to the rule, was perhaps worth considering anew; but the conclusion that it is not must be deemed satisfactory to the advanced philosophy. This result, however, could scarcely be arrived at without a good deal of explanation. Indeed, those who have not at command sufficient patience and concentration of thought may, after all, not see the joke, which we therefore beg leave to try to elucidate.

Now if Mr. SEDDING had put the proposition in an alternative form, and asked whether modern architecture is worth dying for, the answer would have been just the same; and so would the joke. To make the pleasantry even more piquant and delightful still, he might have inquired whether the Queen of the Arts, supposed to be reigning in beauty, as he intimates, at No. 9 Conduit Street, Hanover Square, is worth committing suicide for, taking, perhaps, "a cup of cold pison" after the manner of the immortal namesake of the architect of the National Gallery. The answer would have been just the same; and the joke, to the profane, might have been almost more intelligible. The matter, after all, lies in a nutshell. Does the business of an architect in these days—this is what Mr. SEDDING really means—afford to an infatuated enthusiast an adequate occasion to defy all common sense, to pass a short life and a merry one in a frenzied fever, and, in a blaze of glory, to go to the gods who love those that die young? We beg leave to echo the answer that it does not; the happy chances being a thousand to one that the most frantic of such youths is, by the beneficial influence of sheer necessity, reduced in good time to the condition of a rational being, and enabled to learn that architecture in another sense may be very well worth living for indeed, as a most useful and most agreeable occupation, highly honoured in the person of its experts, and quite satisfactorily rewarded.

Mr. SEDDING of course harks back to the Middle Ages. In those very much misunderstood times the typical architect brought to his work "trained powers, sleepless ambition, and passionate devotion." In addressing the young gentlemen of the Architectural Association upon the strength of this assertion, he invites them to ask themselves "whether they look upon architecture as a divinely inspired art that can rightly claim all the devotion of their being," or whether they are rather disposed to "take up architecture merely as an honourable profession and a gentlemanly calling?" If they are to follow the art "with the ardour of a religion," he admits the probability that they may have the misfortune "to live a life of quiet unnoticed worth," which, nevertheless, may be "happy and contented and grateful all the same." On the contrary, if they "go in for architecture as a profession which only needs the efficient handling of a T-square and ruling-pen," they may "rise to be eminent practitioners," when their reward will be great, namely, "access to the best society," the wearing of brown velveteen, a recognition of their connoisseurship in the art world, and the acquisition of certain alphabetical titles, ending with "P.R.I.B.A. if you have paid your subscription and are alive when your turn comes;" all this being on condition only that "you have a head on your shoulders" and "the faculty of turning out just what the world expects from you with promptitude."

Perhaps it is too much to ask so quick a thinker whether there may not be some *via media* to be discovered by the exercise of research and the collection of statistics. May not

an architect be enthusiastic in his art, delighting daily in the work of his pencil, eager for its successful realisation, and never sparing himself in secret study and labour lest he should leave a stone unturned under which a gem might lie—may he not be earnest in season and almost out of season, making no fuss about it—or even making a not quite unreasonable amount of fuss if human nature must have it so—and yet all the time be "rising to be an eminent practitioner" and "P.R.I.B.A. when his turn comes," having on his shoulders the solid head of a true man, and not the flighty shell of a feather-brain, and priding himself expressly upon his possession of the invaluable "faculty of turning out just what the world expects from him with promptitude?"

The expression of an airy derision for the arts and artists of our native land has long been one of the cheapest forms of a style of criticism which is almost peculiar to England. In the ordinary leader-writer of the newspapers, this intellectually contemptible and wholly vicious practice is as excusable as it anywhere can be, because he is probably a smart young limb of the law, who not only has it for his very vocation to dispense with sober facts, and, if necessary, to defy them, but is seeking a byway to bread and cheese because he has, as yet, not hit upon the highway. But when it is a member of the fraternity of artists who takes up the pitiful song, forgetful alike of national patriotism and of loyalty to his order, he must not complain if he be taken at his word, and, with such solemnity as befits the attitude of the accused rather than of the accuser, called upon to say plainly, as in the presence of his brotherhood, what it is he complains of. What answer, then, would Mr. SEDDING give to such a demand? Let him state the case soberly, quoting, if he can, in an intelligible way, chapter and verse of some sort. Looking at the highly figurative nature of his language, we may not be able to do this for him, but let us make what attempt we honestly can.

"These are critical times for us," says Mr. SEDDING. "A strange calm has come;" "a time of disillusionising alike for architects and for people," "when people are beginning to question the *raison d'être* of the architect at all." More particularly, in the Institute of British Architects, "the birds are not only fully fledged, but have feathered their nests, and, like JESHURUN, are not exactly able to soar"—whatever that may mean. Other artists, and amongst the rest the sculptors, "keep no ghosts," he adds; "but the architect's ghosts are legion—on his premises and off them—and he is not one whit ashamed." Again: "One of the noblest provinces of architecture, that of turning necessary articles of daily use into works of art, has fallen from the architect's hands;" we had thought it was rather being taken up by the architect's hand just now in many very charming ways, and with signal success. Mr. SEDDING, however, must not be misunderstood here; he is speaking of "rank and file" architects; not of some whom he would name, but for a reason that is not very clear, with "genuine admiration and respect," and who, we may venture to assert, the more they are entitled to this honour at his hands, would only the more gravely and earnestly deprecate the contempt which their admirer so indiscriminately pours upon all others, and would indeed tell him that in their opinion—speaking not only seriously but somewhat proudly now—there is more good architecture being done in England at this moment, in the aggregate of merit, than in any other country, perhaps, that the whole world contains.

Our rank and file architects, Mr. SEDDING goes on to say, may certainly claim the credit of having accomplished something in "iron joists and D-traps;" but "architecture" (is this the fine art now, or what?) "has ignominiously resigned her throne," &c., &c., "and only reserved for herself the sovereign right of levying a tax of 5 per cent. on other men's labours." Then "the engineer has robbed the architect of one-third of his domain, and the decorator and manufacturer of another third." Also "the architect of to-day need not be anything more than a paper draughtsman to sit on a stool and invent new sorts of doors and windows," "varying this occupation by occasional jobs for an engineer, who hires him to do the 'pretty' upon a bridge or railway-station." Alas, we wish he would!

Having thus effectually demolished our existing architectural world, Mr. SEDDING proceeds boldly enough to reconstruct it on another basis; but want of space prevents us from following his speculations, especially as they end in speculation after all—what little of them has not volatilised by the way, or exploded in the grim laughter which it seems to be his

principal object to create. Amongst the rest, as a closing recommendation, he would have a "technical college for architects and craftsmen," by virtue of which we should be enabled to "feel perfectly secure about the architecture of the future," seeing that "the hope of English architecture must come from the workshop and not from the architect's office." This last sentiment we have heard before; it was brought out some years ago in the *Quarterly*, and was known at that time as the doctrine of "the inspired mason." Nothing came of it then, and nothing can come of it now, except a jest. Perhaps Mr. SEDDING is only in jest from the beginning to the end of his story. We prefer to think it must be so. But even a jest may be in questionable taste, and there are many of the readers of this "lively sally" who will scarcely form so high an opinion of its author as he seems to wish. If he has given us a view of "architecture which is not worth living for," it is certainly not the architecture of English good sense, even in jest.

### CLOISTERED ARCHITECTS.

THE discussion of Mr. SEDDING's paper at the Architectural Association would suggest that more or less scepticism is arising about the claim of Mediæval and later ecclesiastics to be called architects. It is indeed difficult to believe that WILLIAM OF WYKEHAM could discharge his duties as a bishop and a chancellor, in so troubled an age as that of EDWARD III., and give attention to the details of building. The ups and downs of a courtier's life in those days were not favourable to designing, and a man whose position was so precarious that he was compelled to stoop to bribing a king's mistress for the restoration of his temporalities, and who at one time was under sentence of exile, was unlikely to have that mastership of style which is seen in the work that is associated with the Bishop of WINCHESTER's name. It is not improbable that his lordship had his little weaknesses, like many another statesman, and condescended to assume the responsibility for his assistants' productions. But the objections which may be raised in regard to WILLIAM OF WYKEHAM's architectural skill are not equally potent against all ecclesiastics. Bishops, priests, monks, lay brothers have designed buildings and superintended works in an efficient manner. They may have been exempted, however, from many of the troubles that are inseparable from contractors and workmen. This is sufficiently shown in the case of one order—the Dominicans—through the zeal of Padre MARCHESE, who has collected the records relating to art which are found in the Italian convents of the Order.

The records begin with FRA SISTO and FRA RISTORO, who are supposed to have been born about the same time, that is, between A.D. 1220 and 1225. They would in that case be older than CIMABUE. There seems to have been a sort of partnership between them. The two lay brothers were employed to complete the construction of vaults belonging to a building in Florence which had been commenced by JACOPO, and they were so successful that afterwards they were entrusted with the rebuilding of the bridge which was called the Carraja. This is not the bridge with that name which now spans the Arno. Tradition credits them with other public works in Florence. But their best example of their powers as architects is the Church of S. Maria Novella, the "Sposa Gentile," or "la sua sposa" of MICHEL ANGELO. The building must have appeared pleasing in the eyes of the Florentines, for it is there that Boccaccio supposes his immortal story-tellers to meet after the plague of 1348. The works lasted for about forty years, and during that time the superintendents were all Dominicans. It is supposed that the fame of the two architects reached Rome, and that they were summoned by the Pope to construct vaults in his palace. MARCHESE believes that they also designed the church of S. Maria sopra Minerva, in which, in spite of alterations, he traces resemblances to their Florentine building. FRA RISTORO died in Florence in 1283, and FRA SISTO in Rome in 1289. In what way they co-operated, whether one was a designer and the other a builder, is unknown. They were evidently men of ability, and CIGNARA may well be surprised at the oblivion which has surrounded them.

The success of the two monks must have attracted their brethren, by showing the advantages of architecture. A FRA MAZETTO was sent in 1300 to superintend the works at the church of St. Dominick at Prato, which is said to have been

erected at the cost of Cardinal NICCOLO, the papal legate. In the early part of the fourteenth century not only churches, but many hospices, were erected by the Dominicans in Tuscany, and it is claimed that the architects, masons, and stone-cutters were all members of the Order. One of the reforms introduced by SAVONAROLA was the union of artistic employments with devotional exercises in the monasteries. He enjoined that lay brothers should master some one art, such as sculpture, painting, architecture, construction, or illumination, and by means of their labour they could bring money to the convents. The preachers would thus be rendered independent, and consequently be able to attack abuses without any thought of the loss of support which might follow.

The monk FRANCESCO COLONNA, who was born in Venice in 1433, has a reputation as a romancist or fabulist rather than as an architect. MILIZIA will not give him credit as a writer, and alleges that COLONNA's big book cannot be read on account of its absurdities. ARIOSTO or TASSO has, he says, as much right to be called an architect. But the admirers of the friar maintain that these objections arise from MILIZIA's inability to understand the book. Indeed the title is enough to deter a reader. COLONNA's art romance is called "Hypnerotomachia di Polifilo," or "The Combat of Love in a Dream!" Allegory is so intermixed with description, it is often impossible to say what is the author's meaning. But as COLONNA was a traveller at a time when Egypt and Greece were less known than Africa is now, there may be information in his pages respecting works which no longer exist. He appears to have copied inscriptions and measured ruins, and to have tested the statements in VITRUVIUS as often as he could. D'AGINCOURT had a high opinion of the romance, which, he says, had a most beneficial effect on the age, and aided in the revival of art. It was evidently studied by artists. GIOVANNI BELLINI is said to have designed woodcuts for one of the editions, MANTEGNA was inspired by it when he painted the *Triumph of Julius Cæsar* for the theatre in Mantua, and BERNINI was under the influence of the romance when he placed the obelisk of St. Maria sopra Minerva on the back of a marble elephant, which FERRATA had carved. COLONNA's book was translated into French in 1546 by order of FRANCIS I., but it is incomprehensible to Frenchmen. ISAAC DISRAELI does not appear to have read it, as all he tells us about it is that COLONNA being afraid to put his name on the title-page, and yet wishing to assert his authorship, adopted the expedient of selecting initial letters that, combined, might form his name. The book is far from being a creditable production, especially for a monk, but its existence is evidence of the interest taken by the Dominicans in architecture. COLONNA's fellow monks could not enjoy the adventures of POLIFILO unless they had a theoretical knowledge of the art.

JOHN BUNYAN described the senses as the five gates of Mansoul; COLONNA in his dream represents them as nymphs, which are handmaids to the soul—Freewill is the queen. In the first chapter the author tells us how he wandered along a desolate shore, from whence he entered a gloomy forest. Then in his fear he prays to DIESPITER. Afterwards he is parched with a thirst, and just as he is about to drink from a stream a syren sings and he follows her. Next he sees in a valley the most wonderful architectural objects, and in describing them he introduces the precepts of VITRUVIUS and LEON ALBERTI. There is about the book all the incoherence of dreams, and in consequence every one can give their own interpretation of what is said. No one has had the courage to utilise it.

It is probable that COLONNA may have been the associate of the more renowned FRA GIOCONDO, of Verona. This monk was one of the greatest of the Dominican artists. He began his career by preparing an account of the Roman remains, which was presented to LORENZO DE MEDICI. Entering into the service of the Emperor MAXIMILIAN, he was employed on the repairs of the bridge at Verona. FRA GIOCONDO adopted the expedient of strengthening the piers by driving a double row of piles around them. His experience in construction was turned to account in editing books, and he produced a sketch of CÆSAR's bridge over the Rhone, and corrected many errors in the copies of VITRUVIUS. LOUIS XII. invited him to France. In Paris he constructed two bridges; one was a bridge near the cathedral of Notre Dame, which SCAMOZZI considered to be the best-constructed work in the city. While in Paris he discovered a manuscript of PLINY's letters. It was printed by MANUTIUS, and the descriptions of the Tuscan and Laurentine villas belonging to the consul have

been from that day the subjects of much controversy. FRA GIOCONDO held the position of "Royal Architect" according to one account, while in another he is described as "Reconstructor of Edifices in Stone." His success excited jealousy, and, in consequence, he accepted an invitation sent by the Venetians, who were then suffering much inconvenience from the filling-up of the lagoons by the Brenta. Many plans were proposed, but one by GIOCONDO was adopted, after a great amount of opposition. In the course of a few years the friar (who meantime had left the Dominicans for the Franciscans) is found defending Trevigi against the league in which half of Europe was joined. He anticipated TODLEBEN at Sevastopol by constructing his defence works of clay, and the strength of the fortifications astonished CHARLES V. But no sooner was the work completed than he returned to his architectural studies, and in 1511 produced an edition of VITRUVIUS, on which he had been engaged in his intervals of leisure for several years. The destruction of the Rialto by fire brought him once more to Venice. But his design was considered too magnificent and expensive, and one by SCARPAGNINO was preferred. The old friar indignantly abandoned Venice and turned his steps to Rome, in the hope that he might end his days there in peace. Soon after his arrival BRAMANTE died, and RAPHAEL was appointed his successor in superintending the works at St. Peter's. But the shrewd Pope knew that the painter was without experience in building, and accordingly FRA GIOCONDO was asked to give RAPHAEL the aid of his long experience. "The Pope," RAPHAEL informed his uncle, "has given me as my companion, a most learned friar: he is very old, and has passed his eightieth year. The Pope, knowing that he cannot live long, appointed him to be my colleague, for he is a man of great reputation, and exceedingly wise. I shall learn of him any fine secret that he may possess regarding architecture, and I hope thus to become perfect in this art." FRA GIOCONDO was engaged on the works at St. Peter's during four years, receiving twenty-five ducats a month for stipend. According to some authorities he was the architect of the fine hall at Verona, and when nearly ninety years of age he returned to the city, and may have died there. FRA GIOCONDO was a type of those wandering scholars, soldiers and artists of whom one so often reads in the early days of the Renaissance. A citizen of the world, he was ready to give his skill to any employer. But on reading his biography, it is difficult to understand how, amidst so precarious a life, he was able to produce editions of Classic authors, copy inscriptions, and combine hydraulic and military engineering with architecture. Among the many-sided men of that age he holds a prominent place.

It is noteworthy that the architects who belonged to the religious orders were restricted apparently to certain classes of work. They built churches, but as many of the men who were employed under them were likely to have been lay brothers, or members of religious confraternities, the anxiety of the superintendents was lightened. The principle of a fair day's wages for a fair day's work was not acted on, and there is enough to show that the humblest labourers were sometimes in a state of enthusiasm, while toiling like beasts of burden. Then again, in the public works the ordinary laws of political economy were set aside. The friars were, therefore, in favourable positions for the display of their talents. It is remarkable that we rarely hear of them as architects for private buildings. The great lords may have called in a Dominican to plan a work of drainage, or fortification, or tunnelling, or bridge building, knowing that the expenses were to fall on his subjects and tenants. But it was different when he contemplated the erection of a castle for himself. Secular advice was then considered the most efficacious and economical. While, therefore, the ability of the men who prepared their designs in quiet monasteries in France, Germany, and Italy must be admitted, it does not follow that they would have been equally successful if they had been hampered by the conditions which surround everyday work in this world.

**A Catholic Church**, which was erected from designs by Messrs. Pugin & Pugin, has been opened at Airdrie, N.B. It consists of nave, aisles, chancel, and baptistery, and a tower, which is to be surmounted by a tapering spire. The total length of the church is 112 feet, and the nave and aisles 50 feet. The height from the ground to the ridge of the roof is 47 feet. The style of architecture is Early Decorated. Carlin stone has been used throughout, with polished dressings and rock-faced facings. The builder was Mr. John Denton, of Glasgow.

## ROYAL SCOTTISH ACADEMY.

THE annual meeting of the Royal Scottish Academy was held on the 12th inst. The following members were elected office-bearers for the ensuing year:—Council—Sir William Fettes Douglas, president and trustee; Messrs. W. D. M'Kay, J. Dick-Peddie, J. B. M'Donald, W. Beattie Brown, John Smart, and W. E. Lockhart; secretary and trustee, Mr. George Hay; treasurer and trustee, Mr. J. M. Barclay; trustee, Mr. William M'Taggart; auditors, Messrs. Gourlay Steell and W. E. Lockhart; librarian, Mr. John Hutcheson; curators of library, Messrs. W. D. M'Kay and J. Dick-Peddie; visitors of the Life Academy, Messrs. J. M. Barclay, W. E. Lockhart, Robert Gibb, and Otto T. Leyde.

The annual report by the Council, which was submitted to the meeting, stated that the attendance of visitors at the exhibition last spring was considerably above the average. At the annual general meeting, held on November 14, 1883, Thomas Stuart Burnett, sculptor, Patrick William Adam, and George Whitton Johnstone were elected to the rank of Associate, to fill the vacancies caused by the election of W. D. M'Kay to the rank of Academician, the death of Mungo Burton, and the resignation of R. Rowand Anderson. At a special general meeting, held on November 26, J. W. Oakes, A.R.A., and Thomas Graham were elected to the rank of honorary members of the Academy. At the statutory meeting, held on February 10, William Beattie Brown was elected to the rank of Academician, to fill the vacancy caused by the death of Robert Gavin. At the statutory meeting in February next, the Academy will be called upon to elect an Academician in place of the late Arthur Perigal. The librarian and curators of the library report that there has been an increase in the attendance of members in the library during the past session. The librarian has completed the classification and arrangement of the large collection of drawings bequeathed to the Academy by the late David Laing, H.R.S.A., LL.D. The collection is arranged in sixteen volumes folio, and contains sixteen hundred and sixty-one drawings. The librarian has also compiled an index to the contents of each volume. The visitors of the Life School report that the session of 1883-4 commenced on November 15, 1883—being fully a week later than usual, owing to a new stove being fitted up in the class-room—and ended on June 27, 1884, including 116 morning and 116 evening meetings. The aggregate evening attendance was 2,040, or an average of 17 per night; and 1,729 was the aggregate morning attendance, being an average of 15 per morning. The visitors testify to the diligence and progress of the students generally, and to their gentlemanly and decorous conduct. The Council are glad to observe the generally high quality of the work done in the Life School, and are specially gratified with the progress of several of the younger students. It is with much pleasure also that they express their approbation of several of the works sent this year in competition for the Stuart Prize. In design and composition they are much superior to those submitted in recent years; and the earnest effort evinced in the study of these important qualities deserves warm commendation. The works of the students in this year's exhibition having been previously examined in order to decide the Keith Prize, the studies and competition designs were also carefully scrutinised, and the prizes awarded as follows:—

For painting from the life (the Chalmers prize)—C. A. Sellar and J. Bowie, equal. For the best drawing from the life—J. Allison. For the second best—J. K. Ferguson and G. Denholm Armour, equal. Keith prize, for the best work of a student in this year's Exhibition—T. Scott and G. Denholm Armour, equal. MacLaine Watters medal—C. A. Sellar. Stuart prize—T. Scott and C. Mackie, equal.

Several studies from the life executed in water-colour by T. Scott, also basso-relievos from the life, executed respectively by J. S. Rhind and W. Martin, deserve honourable mention. The following among other additions have been made to the Academy's collection of works of art, &c., during the past year:—

*Coire-na-Faircamh*, diploma work of William Beattie Brown, R.S.A.; *Portrait of Professor John Stuart Blackie*, H.R.S.A., by James Archer, R.S.A., presented by Mr. Archer; 161 proofs of engravings, by William Forrest, H.R.S.A., engraver, presented by Mr. Forrest.

A special general meeting of the Academy was held on November 26, 1883, for the purpose of considering whether West Princes' Street Gardens was a proper site for the proposed Forestry Exhibition. The members unanimously condemned the proposal, and resolved to memorialise the Town Council on the subject. This, however, was rendered unnecessary, it being found that buildings could not legally be erected in the gardens. The threatened outrage was thus happily averted. The Academy, at a meeting held on April 10, resolved to address a letter of condolence and sympathy to the Queen on the lamented death of His Royal Highness Prince Leopold, Duke of Albany. At meetings held on March 19 and June 24, memorials were addressed respectively to the Prime Minister and the House of Commons in favour of the proposed restoration of the Castle Hall, and of the "Access to Mountains (Scotland) Bill." The

Academy, in recognition of the tercentenary of the Edinburgh University, during the celebration of its festival held in honour of the occasion, had the pleasure of giving, on April 18, an afternoon reception in the galleries of the Academy, en suite with those of the National Gallery. A very numerous company was present, including the distinguished delegates and guests of the University. The University having invited the Academy to send a delegate to their tercentenary celebration, the Academy unanimously appointed their President to represent them on that occasion, when the honorary degree of LL.D. was conferred on him. With much regret the Council report the loss sustained by the Academy in the sudden death of their esteemed treasurer, Arthur Perigal, one of the oldest members of the Academy. He was elected an Associate in 1841, and attained the rank of Academician in 1868. A minute was unanimously adopted at a meeting of Council, held on June 14, briefly recording the facts of Mr. Perigal's career, and expressing the esteem in which he was held by all his professional brethren. At a special general meeting of the Academy held on June 14, convened in accordance with the laws, to fill the vacancy in the treasurer'ship, J. M. Barclay was elected to the office.

### GLASGOW ARCHITECTURAL SOCIETY.

THE opening meeting of the architectural section of the Philosophical Society of Glasgow was held on Monday in the Institution Rooms, Bath Street. Mr. James Sellars, the president of the section, took the chair.

The President delivered his opening address. Beginning by a reference to the recent discussions on the subject of the dwellings of the poor, he expressed the opinion that the model houses which have been erected in London and elsewhere were neither suitable for, nor indeed intended for, the very poor. The rents were necessarily beyond their means, and it would be precisely the same in Glasgow, or any large city, where ground is valuable. Is it coming to a time, he asked, when State or municipal aid will have to be given to enable the kind of houses required to be built? I think it is. I do not see any reason, except the financial one, why large groups of buildings, which I will call barracks, for want of a better name, should not be erected in certain districts in which the houses would be built of the most indestructible materials—for that is essential—and arranged on the best sanitary principles, with suitable baths and washhouses attached to each group, and which would be under constant supervision and inspection in order to compel attention to sanitary rules. This would come very near what has hitherto been considered an impossibility—namely, compelling people to be clean by Act of Parliament, and it is not unlikely to be considered revolutionary—an outrage on the rights and privileges of a free people. But virulent diseases require strong remedial measures, and after all it would only differ in degree from what our authorities do at present. They restrict, and very properly so, the number of persons who may occupy small houses, and in a variety of ways regulate and inspect the arrangements of dwelling-houses and their adjuncts, and the idea which I have ventured to bring before you is only carrying the principle already acted upon a little further. As regards the financial aspect of the question, I have already indicated that I do not think houses of the kind required could be built in Glasgow to pay, and some money sacrifice would have to be made in the first instance.

Turning now to other questions of interest to us here—questions, however, more local in character than the one just referred to—I will first ask your attention to the subjects recently brought prominently before the public by Lord Dean of Guild M'Ewen, viz.:—The condition of house drainage in the city, and the question of exits from public buildings. His lordship pointed out that many of our public buildings are in a very unsatisfactory condition in respect of exits, and his opinion has only too soon received a fearful verification in the appalling catastrophe at the Star Theatre two weeks ago. In considering the powers of the authorities in connection with these and other subjects to which I may refer to-night, I will briefly consider the powers—that is, as I interpret them—vested in the authorities under the present Police Act, those sought to be obtained by the proposed new Police Act, and those provided in the Burgh Police and Health (Scotland) Bill. In regard to this question of exits from public buildings, the powers at present possessed by the authorities appear to be very limited; and the clause in the proposed Glasgow Police Act was almost identical with that in the existing Act. The General Police Bill contains a clause of similar import, but with this very important addition, that the means of ingress and exit shall be approved by the Commissioners from time to time as they may deem necessary, and further, existing buildings used, or proposed to be used, as a place of public entertainment, or for holding large numbers of persons for any purpose whatever, shall be inspected, and, if found unsatisfactory, then they must be altered to the satisfaction of the Commissioners. These latter provisions are better than we have at present in Glasgow, or proposed to be had, in respect that they provide, not only for the accesses and exits being sufficient and properly planned to begin with, but also for inspection and supervision after they are in use. Theatres in

Glasgow have to be licensed year by year, and the means of exit, &c., are annually inspected; but that does not, I think, apply to music-halls or other halls, although it is hardly less necessary in the one case than in the other. I do not think that the clause in the latter Bill goes far enough. There are certain things which may be ascertained and fixed, such as the proper width of doors—and that should certainly be done. Mr. White, our able assistant master of works, gives it as his opinion that every public building should have the doors of such width that there would be one foot of exit space for every seventy persons the building can accommodate. Further, the widths and kind of stairs, if any, should be fixed and described—the stairs of no less width than the doors, and having no square corners on the landings. The gradient of the stair might also be fixed at not steeper than, say, 1 in 2, and that separate egress direct to the street should be provided for each floor or gallery in the buildings wherever possible; or, at least, and this ought to be imperative, in no case should it be possible for two streams of people to cross each other's path in a stair or passage, and where a stair was used for several floors, it should be increased in width at each flow in proportion to the additional number of persons who used it from that point. Consideration should also be given to the position of the doors in a hall; if they can only be at one end of the hall they should be wider than the same number of doors distributed over the hall. In connection with stairs, I would suggest that if it is necessary, as I believe it is, to put gates or movable barriers across them, and the same applies to passages, for the regulation of crowds entering a building, then it would be very desirable that there should be separate stairs for exit only; or a person appointed by the authorities to see that these gates or barriers were opened or removed immediately after the entertainment began; and it might be the duty of the same official, or officials, to see that all the exit doors were opened for use at the end of the entertainment, and so fastened during the entertainment as to be ready to open outwards under the slightest pressure. So far as I know the Glasgow authorities have no power to interfere with internal alterations of buildings, except in the case of dwelling-houses, after they are in use, therefore they may approve of plans of public buildings showing perfect arrangements of stairs and passages and ample exits, but which stairs and passages are in practice so mismanaged and obstructed by gates or barriers not shown on the plan, and which exit doors are never open, or openable, when the need comes, that the best skill and experience they can bring to bear on the matter is futile without the power to see that the wide passages are not reduced in width by barriers or gates, and that the exit doors provided by the plan and made in the building are used. Every exit door in any hall should be opened on all occasions when the hall is in use, but simply to make sure that they are always openable, that their hinges and appliances are kept in working order, so that when the crisis comes, as it may come any day, they will not be found rusted or jammed up from misuse. I have no doubt all such matters will now get due attention from the authorities, and that recent experiences here and elsewhere will lead them to obtain the necessary legal powers, if they have not got them already, to compel the owners of theatres or halls not only to provide satisfactory arrangements, to begin with, but to keep them in working order, so as to secure, in the highest degree, the safety of the public in all possible circumstances.

As regards the other, and certainly not less important, question dealt with by the Lord Dean of Guild, viz., the drainage of dwelling-houses, something has already been done towards their general improvement, though not by Act of Parliament. The drain-testing carried out by the sanitary department and the Glasgow Sanitary Protection Association (the operations of the former being of course confined within the municipal boundaries, and the work of the latter being within and without the city) revealed a condition of things which is nothing less than appalling. Out of hundreds of house-drainage systems examined a very trifling proportion, less than 5 per cent., I think, were pronounced entirely satisfactory. It does not of course follow that the other 95 per cent., assuming that to be the proportion, were necessarily dangerous to health, because the imperfections in many cases might be slight and unimportant, and the test applied is a very severe one, the smoke being driven through the pipe under considerable pressure. Yet I have no doubt that it is a fair statement to make, that at least 50 per cent. of all the houses examined were in a condition as to drainage prejudicial to health. Now, when you consider that as far as the work of the Sanitary Association is concerned, at least, the tests were applied to houses of the better class, generally erected under some kind of supervision, it is a fair conclusion to assume that thousands of the common blocks of tenements—very frequently erected without any kind of supervision—must be in a much worse condition. It is not to be forgotten, of course, that many of the houses inspected were old houses, some of them erected before drain pipes were invented, for that is not so very long ago. Indeed, I am informed that some of the stately terraces in the West End, commanding magnificent views of the valleys of the Clyde and the Kelvin, had only the old-fashioned built drains when they were first erected, and it must be within the knowledge of many present, as it is within my own very

recent experience, that that very unsatisfactory and antiquated form of drain still exists in otherwise excellent houses in first-rate localities. Any sort of test applied to drains of that kind, however well made at first, but left to take care of themselves since the time they were laid, could not have any other than an unsatisfactory result. The very best and most scientifically-arranged systems of drainage will not last for ever under the most favourable conditions possible, and therefore they ought to be periodically tested. Thirty or forty years ago, when built drains were common, to get rid of the nastiness in any way was the principle acted on. No drain at all is better than that condition of things, and yet I do not know that it is altogether obsolete even in Glasgow, and certainly not in some of the smaller burghs and populous places—even some of the fashionable health resorts on the Clyde.

Let us now see how far our authorities have gone to prevent such a state of matters being continued in the erection of new houses, and how they can interfere with it in existing buildings. In the Police Act there does not appear to be any clause—apart from that relating to public sewers—dealing with house drainage; that is, that the connection with the main drain in the street is to be properly made. There the control seems to end. In the proposed new Act, however, very ample provisions are made, and the same may be said of the new Burgh Police and Health (Scotland) Bill. Having quoted the provisions in the two Bills, Mr. Sellars continued—On the whole, however, I think that the clauses in the new Glasgow Act in regard to drainage of new houses are better for Glasgow than those in the Burgh Police and Health (Scotland) Bill, and especially so that they are more definite in describing the manner in which drains are to be laid and ventilated, and less is left to the opinions of the Commissioners or Dean of Guild Court, for the time being. Mr. Sellars went on to notice several other points in these bills. In the first place, the manner in which the question of the height of buildings, in relation to width of streets and free spaces behind buildings, is treated. The difference appears to him to be in favour of the provisions in the Glasgow Police Bill. Not only did the latter provide wider spaces, but it also provided for the discontinuance of the arrangement of blocks of houses known as hollow squares, by having an opening in the end, or cross blocks of building, to permit a free passage of air through the space between the backs of the houses. Another objection to the Lord Advocate's Bill was that it had no provision regulating the height of buildings. He further discussed the several Acts in regard to their provisions for protection from fire, and for the preservation of the health of the community, and, in summing up, said he was of opinion that Glasgow, with its well organised and capable sanitary department and office of works, would be better under the provisions of its proposed new Police Act than it would be under the Burgh Police and Health (Scotland) Bill, and that the latter, admirable as it is in most respects, failed in not providing for the proper administration of its provisions as to building regulations and drainage of houses, &c.

On the motion of Mr. David Thomson, seconded by Mr. James Howat, a vote of thanks was passed to Mr. Sellars.

### MR. RUSKIN'S LECTURES.

THE subject of the fifth lecture of Mr. Ruskin's Slade course for this year was "Protestantism: the Pleasures of Truth." The professor said that the space of history in Christendom of which the temper was represented by the changes in architecture and in all other art, and which he proposed to illustrate in that day's lecture, was not definable by the reigns of kings, because it took place in different parts of Scotland, Ireland, and the Continent, especially Germany, at different times. He could therefore only define it by its character, calling it the period of Protestantism—that was to say, the bearing witness for spiritual truth against manifest falsehood, or the bearing witness against such falsehood in the interests of justice. There were two protests which were absolutely distant, and merely by chance coincident. The first protest for the principle of religion was in all countries that properly termed the Reformation; the second protest—that for the right of the subject—was properly called and known in all countries as the Revolution. The Reformation meant, in the summary, John Knox; they could thus always concentrate the regular policy of the mob movement into one man, who was its head—Luther if they liked, but he liked Knox better. John Knox was the Reformation; John Hampden was the Revolution. The one said, "I won't be cheated in my religion;" the other said, "I won't be taxed in my pocket." It, indeed, happened continually that the Protestant was fighting at once against lies and taxation. All the beauty of Protestantism they would find embodied by these two great masters, Scott, for English, and Goethe in Continental literature. He read further from the chapter on "Divine Right" in "St. Mark's Rest," and coming to a description of Venetian maritime enterprise, he stopped, and, referring to our own Navy, said we spent about a hundred times more now than we used to spend, upon what he called iron bubbles, which only burst. He had a cousin who went down in the *London*. There was nothing the matter with it, except that it was made of

iron instead of wood by those donkeys who governed such matters. It was not the scarcity of wood which led to the building of iron-clads—not at all; it was the competition of ironmongers, who got the poor Government—the Government was honest enough, but the goosefied Government was hunted down by these ironmongers, and had simply purchased those pretty toys of ironclads that the ironmongers might have something to do. What had taken place? They simply went upside down, and there was nothing so costly in all naval expenditure as the loss of the *London*. And what was the reason! Because it was built of iron. A gale was nothing at all to a wooden ship—Venice would have laughed at it, rejoiced in it. They never heard of a Venetian being upset or making for the shore. Why? Because they had been broken in to the life of the rough sea. But with the *London*, she was crossing the Bay of Biscay when it got a little rough; the wind blew the bulwarks down, and down the ship went bodily. The only grand thing connected with it was that the captain, looking over the bulwarks as the last boat was launched, gave the crew their latitude and said he would go down with his ship, and he did. Contrast this with our present-day seamanship. We thought it something in war, did we? It was some bombastic blarney—Irish—no, English blarney, because there was always some wit at the bottom of Irish blarney; but English blarney was nothing but a double blunder. Why, what did they do? They went to fight in the Baltic; they knocked their head against Cronstadt and came back again. Cronstadt cared as much for them as for a straw. They next went to Sebastopol; they hurt their head there, but it was glossed over by lies in the papers. Of course they all knew well enough in their hearts that the British fleet got considerably well licked. Why lately they had been very nearly caught by a few Arabs, and the whole thing that did them credit was the gallant action of young Cochrane, who did more than the whole fleet did. They might say all that was irrelevant, but they did not know of a finer art than shipbuilding, and they would find that out when he set them to draw ships; they were only drawing shells now. Even a draughtsman could not draw two sides of a ship alike; nobody but Turner ever did. They might say one of the subjects forbidden to him was political economy; but they would find it would be forced on them all pretty soon. When all the present ships were destroyed (the Government would ask for a loan pretty soon), the new ones would also all go to snap in a very short time. Mr. Ruskin concluded his lecture by reading a passage from Scott's "Lady of the Lake," and observed that he found scarcely anybody had any poems or novels of Scott. Therefore, he was going to send them forth by the gross among the schools of England—not as prizes, but for governesses to give to good girls. He would recommend that the pupils should draw lots for the volumes. The governess might say, "Here is a pretty book; I do not know who shall have it, so it shall be drawn by lots." The girl who then got it should choose to whom she should give it away to. That would serve the purposes of a very subtle little moral lecture. The subject of the next lecture will be "Atheism: the Pleasures of Sense."

### THE LAYING-OUT OF FEUING GROUNDS AND THE PLANNING OF HOUSES.\*

BY JAMES GOWANS, ARCHITECT.

BEFORE laying-out new ground the adjoining proprietors should be consulted so that the line of streets and approaches work into each other. If conterminous lands are laid out without considering the relation one bears to the other, the result may be that through-and-through accesses may afterwards be unobtainable, or the route made so circuitous as to be a great impediment to the general traffic of the city. Instances—want of access from Greenhill Gardens to Whitehouse Loan; Lauriston Gardens to the Meadows; West Fountainbridge to Dalry; and Dalry to Coltbridge district. Besides the public inconvenience thus brought about, the drainage is often necessarily imperfect, arising from a want of comprehensiveness in at first dealing with the subject in reference to the particular grounds which each individual proprietor may possess, as a whole.

If old trees are on the ground they should be preserved by making the plan, as far as practicable, subservient to them, and the streets should be wide enough to admit of trees being planted along the footpaths. Besides the charm of a shady walk in summer and the effect they have in softening and clothing the hard line of our streets, trees are known to possess health-giving properties, in a very high degree; and nothing would tend more to the embellishment of our streets than rows of well-grown and well-preserved trees.

In my experience of planting trees in the city, I find that elms thrive best. Those in Castle Terrace were transplanted from the embankments of the Edinburgh and Glasgow Railway, where they had grown for about thirty years. Few of them failed to grow, the

\* A paper read at a meeting of the Edinburgh Architectural Association on November 17, 1884.

failures being occasioned more by thoughtless boys from the adjoining schools breaking down the branches and peeling off the bark, and so wounding them past recovery. Trees, to thrive in a town, as in other situations, require suitable soil to nourish them, free from the poisoning influences of gas, with which the ordinary soil is often saturated. If fresh earth is supplied and care taken of the roots in transplanting, trees will grow vigorously in any of the streets of our city which are wide enough to receive them.

To give plenty of open space both back and front, more especially to continuous houses, tenements of houses should be placed so as to admit sunlight and a free current of air. In the suburbs, where each villa has its quarter or half acre or more, there is no want of open ground. I plead for ground that is being built over by tenements so high and so close to each other that sunlight cannot penetrate to dispel the damp atmosphere that thereby exists all the year round. The architects who laid out the New Town sixty years ago had more enlightened ideas of what was valuable in this respect than we have at the present day, and unless the authorities get some power of control, or secure in time open spaces, there will be another City Improvement Scheme needed to pull down the houses now being erected so densely all round this city. In laying out some ground of my own, I am keeping spaces open at the angles, having continuous houses in the centre with villas at the corners. This arrangement allows a free current, and prevents the erection of corner tenements which cannot be planned so as to admit of the necessary light and air.

The drainage should be well considered, and the line and level accurately laid down, and afterwards adhered to. Where it can be got, the sewage should be at the back of the houses, with a separate drain for the roof water in front. If the houses are well planned, with the closets, &c., at the back, this prevents the drains passing under the building, which are so highly objectionable. If the drainage can only be placed in the street, then there should be two pipes, one on each side, close to the footpath; and this applies to all piping, such as water, gas, telegraph, telephone wires, &c. This is the right thing to do, on the score of economy; smaller drain-pipes will answer, and the crossing and recrossing of streets would be obviated, besides avoiding the cost and annoyance of having the centre of the streets opened up, and the paving destroyed, wherever junctions or repairs have to be done.

The drains should be well ventilated, having plenty of openings to let the air in and out. The more you disseminate the dangerous gases of close drains by inlets and outlets, the less risk there is of disease being propagated. To have our main sewers sealed up as they are, seems to me to fly in the face of all sanitary knowledge. With drains well ventilated and proper flushing apparatus, the pressure that now exists upon the subsidiary piping of houses, especially those at high levels, would be relieved, and the danger dispelled. What I further desire to see would be ventilating shafts at frequent intervals, carried to a high level, where the living germs of disease would be destroyed, without risk to the people, and with self-acting flushing apparatus, placed on the drains so that a full volume of water would wash them out, and free them from all impurities or gases, which in their escape into our dwellings lead to ill-health and death itself. And now that we have abundance of water, these flushing tanks should be attached to the main sewers, and not depend on the occasional flushing that rain brings about, which cannot be so complete as the full flow from the flushing apparatus.

Before leaving the consideration of feuing ground, I would notice the danger of building on soil that has been saturated with drainage, such as the irrigated meadows and ground alongside of open sewers, like those at Powburn, Broughton, and Dalry, which have already been partly built over, or are fast coming within the range of feuing purposes. The same remark applies to ground that has been made up with rubbish of an offensive kind. To erect buildings on such a stratum is greatly to be condemned, as the heated air of houses so placed draws up from the soil an atmosphere which may be charged with the deadliest elements.

#### *Planning of Houses.*

A house, to be well planned, should be useful and convenient for carrying out domestic arrangements in the simplest and easiest way. The necessity of the architect making this his first consideration is very obvious. A thing to be of the highest value must be useful, and nothing more so than the houses we live in. A house should be arranged so as to suit or even improve the habits of the people who live in it. It should also be a healthy house, otherwise it sadly fails in that which a habitation ought to be. In the matter of convenience and completeness, it should be self-contained, both in and out. This should be striven for in designing houses of all classes, but especially those of the lower. To have one room entering from another is bad planning, and should be avoided; in cases of sickness or privacy it is very objectionable.

If a house is contrived, to begin with, so that it is deficient in that which provides for ample light, ample ventilation, and good drainage, it gradually becomes a diseased house, which nothing will cure, and I cannot impress too strongly the need of designing houses which will prevent as far as possible that share in the death-rate of our city which unhealthy houses lead to. There can

be no doubt that a house that has been subjected to the escape of bad air, the soaking of the basement by leaking drains passing under the building, has the living germs of disease about it, and I cannot state this view too forcibly, as in my opinion there are many such houses in our city, which throws a heavy responsibility on those who had to do with their imperfection in this respect. Drawings of drainage, showing accurate line, as well as the course of bends and level, should be as carefully done as any detail of the building.

Besides having the rooms self-contained, the staircase or lobbies should be wide, airy, and well-lighted. They are the lungs of the house or building. A narrow, dark, badly-ventilated staircase is fruitful of disease, and so is the lobby. At the present moment I see tenements of houses being erected which are sadly defective in this way; by whom planned I know not, but they or the authorities who permit their erection have much to answer for. It is difficult to understand how the authorities can allow tenements of houses to be erected having narrow dark staircases, water-closets in the centre of the building, lighted from the staircases, and with attempted ventilation by a pipe to the roof, which is more likely to supply air to the heated house than draw the vitiated air from it, besides the danger of allowing the air of one house to pass into another, and so propagate disease if such should exist in the building.

Healthy and unhealthy houses, individually or in groups and districts, are perfectly well known to medical men, and it is matter for consideration whether these should not in some unmistakable way be specially distinguished. The effect of this would probably be to bring those who own such houses to see it to be their interest to make them properly habitable.

In the selection of houses a cheap rent is often a great inducement, even to those who can afford to pay on a higher scale; but if this is done to the neglect of sanitary arrangements it becomes foolish economy, as much more may have to be paid for doctors' bills than would have to be expended for better accommodation, apart from the suffering from ill health and its consequences.

In the choosing of houses we are not so concerned for those who have the means, and ought to have the knowledge, to enable them to select a healthy residence. The class we are sorry for are those who from limited means or circumstances cannot pick and choose, but must take what is offered to them, whether healthy or no; and I would point to the need of all proprietors having their houses certified as to their healthiness. If the Legislature provide for the safety of sailors in seaworthy ships and the protection of miners in dangerous mines, action in the direction I have indicated is not less but even more urgently needed.

A newly-built house which has everything clean and inviting to a tenant, may, from some latent defect in the drainage or otherwise, have concealed within it the most deadly element of disease, which a very simple test would bring to light. This being so, why should tenants not demand from proprietors a certificate that all is right in a sanitary sense, before occupation?

The next thing I would press for in designing a healthy house—after providing for separate entrances to each apartment, and plenty of light and air—is to arrange the plan so that those places connected with the sanitary portions of the house are so situated that the drains need never pass under the building at all. The system of passing sewage-drains through and under the building is bad planning, and is one of the greatest sources of disease that I know of. It is a mere question of planning to have closets and sculleries on the back wall of the house, free to be lighted and ventilated direct from the open air, and when this is done drains need not go into the building at all, as pipes are better outside than in. A great danger of passing the pipes inside is that the settlement that the walls of all newly-erected buildings have is apt to dislocate the jointing of the pipes, and so allow the drainage gases to find their way into the house.

I would have all closets clear of the house, with a well-lighted passage, however short, which would allow of a clear through-and-through ventilation between the closet and the main building; and further, I would have these places roomy and well-lighted. To this day some architects adhere to the system of narrow, ill-lighted places, such as existed thirty or forty years ago, when closets were first introduced, and when there was a tax upon light, which was evaded by bringing the daylight of windows under the medium size.

I need hardly say that no closet is perfect unless the piping is well ventilated, and this not by a pipe of smaller size than the soil pipe to which it is attached. Closets should have a cistern distinct from that which supplies the domestic uses, as there is an instant when in using a closet the foul air finds its way up and into the water of the cistern above.

While speaking of cisterns, there should be a place for these which should be lighted and easily accessible for cleaning periodically. The overflow pipes of cisterns, wash-hand basins, baths, washing-tubs, and sinks should all discharge into the open air, and not be connected directly with the sewerage drain. The danger of having these discharging into the drains without the interception of the atmosphere is very apparent, and cesspools cannot be depended upon, as, owing to only occasional use, or leaving the

house unoccupied for a time, the water in the dip dries up, when a free course is given for the inlet of sewage gas to pollute the dwelling.

Before leaving the interior of the house I wish to notice the value and comfort of a vent that has a good draught, and the care that is needed to secure this. In my experience, the throat or oncome at the level of the lintel of the fireplace is often carelessly formed, and allows dead air to accumulate, and so prevents the upward draught; and also, the course of the vent is not carefully defined by plan, so that the builder may line it, as he builds, to a definite point; and again, the chimney head should have thickness and height to prevent the choking of the upward current by the damp air after it passes the roof. Chimney heads should be treated so as to form a feature in the architectural character of the building, and not be got rid of at the earliest possible point of the structure, necessitating afterwards those ugly contrivances which tend to disfigure the sky-line of our principal streets and buildings. From where I write, the beautiful landscape is sadly disfigured by the unshapely ends and backs of houses within sight, and the ungainly chimney heads and disfigurements by which they are topped in the unsuccessful endeavour, no doubt, of getting rid of that discomfort of a house, viz., a smoky chimney.

Another mistake in planning tenements of street houses, where shops have to be introduced, is not taking care to close up the back of the skirting at the level of street floor, so that the evil smells and dangerous air of sunk floors may be prevented finding their way to the upper storeys. Bakeries, butcheries, fruit, and fish shops should be specially guarded against as to this, as I have known tenements through this overlook hardly tenable. As to bakeries, the plan of having them under the ground should be discarded, and well-lighted and ventilated places built on the street level at the back. An inspection of some of the bakeries of the city would show how much could be done not only to provide places which, by being well lighted and ventilated, would not injure the health of those who have to be early and late at their work, and in accordance with what we suppose to be the manufacture of what appears to be so white and pure on our breakfast table.

In ground at present being laid out by me for feuing every endeavour is being used to give effect to the recommendations contained in the brief observations which this paper sets forth, both as to the ground itself and the houses that are being erected on it. I do not wish here to say much as to the exterior of buildings, as that would be away from my text; only I would ask the members to give some consideration to what is called the back and end elevation of their design. The backs of houses should get a fair share of architectural treatment, and I often regret, when passing across the Dean Bridge, that the back of the prominent houses along the ridge above the water of Leith had not some effective features to carry off the baldness of their elevation; but this seemingly has been entirely overlooked by the designers, who have centered their whole efforts on the stately and dignified elevations of the street fronts and interiors of the houses, and neglected a well-shaped broken outline to the back, which would have added comparatively little to the cost, and added greatly to the picturesqueness of the situation.

### ART IN SCHOOLS.

THE first lecture of the session was delivered at the London Institution, on the 13th inst., by Archdeacon Farrar, on "Art in Schools for the Poor." The lecturer said he wished to awaken, if possible, more public interest in the enterprise—that of the Association of Art for Schools. Many of its exquisitely chosen pictures he pointed to on the walls behind him—birds and nests, and eggs, and trees, and animals, and historic scenes, and domestic incidents, and portraits of the greatest of men, and works of the famous painters of Italy and Holland and England and France. At the cost of 5% any school might be furnished with a selection of them. The society believed, and he shared their opinion, that, in this easy way, art, which had been the luxury of the rich, might be made a handmaid to the aspirations of the poor; that they could thus increase the sum of innocent human happiness, and offer a counterpoise to degrading pleasures; that they could kindle in children's minds a love for the beautiful which might second religion as a protection against the grosser forms of self-indulgence. The lecturer showed that where good art is neglected as an agent in education bad art will exert unchecked its vulgarising, its almost dehumanising influence. He insisted that nothing can more clearly show the *doctrinaire* character of our educational system than the extent to which all he had been urging upon their attention is ignored. We had been for years tithing mint and anise and cummin for the three R's, and had been totally disregarding the weightier matters of life—the admiration, hope, and love by which human beings live. One might go into a city school, and the children could tell at once the cost of 27 lbs. of bacon at 9½d. a lb., but might never have breathed the fragrance of a rose or so much as seen a bee. We made art a mere luxury for the rich, when we should glory in making it a free gift to the poor. We made of our schools a *terra incognita*, through having

in them no single object of interest or beauty which might attract any one to visit them. We spent yearly so many millions on education, and yet spared the mere fraction of expense which might help to make school hours more pleasant and school buildings less repellent, while at the same time developing in the children not only a higher intelligence, but also a sense of revolt against things bad and a dislike to everything morally and physically foul. We should not indeed bring Utopia at once into existence by surrounding the nation's children with objects of beauty and noble works of art, but all such work would be in the right direction. Moreover, Utopia was often but another name for time, and should any one foretell from our efforts but an infinitesimal influence for good amid the weltering surge of human misery seemingly threatening our civilisation, he might be answered in the words of an eloquent divine, that "God binds up even the grains of sand in the wings of the wind, that they may become a barrier for the raging of the sea."

### PUBLIC WORKS IN FRANCE.

IN the course of his interview with the Budget Committee last week, M. Raynal, the Minister of Public Works, gave some interesting information with regard to the execution of the public works planned by M. de Freycinet when in office. The construction of the railways has since been made over to the principal companies, but a sum of 35,160,000*l.* remained to be spent upon canals, rivers, and ports, of which 28,520,000*l.* was for canals, 4,000,000*l.* for ports, and 2,640,000*l.* for rivers. A further expenditure of 4,000,000*l.* for ports and 1,200,000*l.* for canals has since been found necessary, the port of Le Havre requiring 2,440,000*l.*, and that of Bordeaux 800,000*l.* It is proposed to raise the money required by loans to the State from the Chambers of Commerce, these loans to be repaid by annuities commencing in 1887, and spread over periods of ten, fifteen, and twenty years. The additional expenditure of 8,200,000*l.* is to be spread over a longer period, and to be provided for out of current revenue.

### THE EMPLOYERS' LIABILITY ACT.

A DECISION has been given by Sheriff Erskine Murray in a curious case, which was brought by a Glasgow journeyman mason against a master mason and builder, to recover damages for injuries. The defendant, John Riddell, whose son acts as his foreman, was in May last engaged in erecting a house, the bricklaying being done by a sub-contractor under him. A shed for stone-cutters was erected outside of the buildings, but the room being scanty, some of the men were sent by defender to work inside the buildings. When this happens, which is not frequently the case, it is both customary and necessary for the employer to provide either a shed or a shelter of planking over the joists above their hewing places to defend the men not only from the weather, as in the case of the outside shed, but from the danger of stones, bricks, &c., falling from above. Neil Blair, whose wages were 29*s.* 9*d.* a week, was sent by defendant or his son to hew inside the building, and a plank having fallen down and injured a stone at which he was working, and a complaint having been made to defendant, the latter promised that a shelter would be erected. A labourer, Curran, was directed to make such a shelter above the place where the stone-cutters were ultimately directed to work, and where their bunks or sieges had already been erected. The shelter so erected was about twelve feet above the hewers and was somewhat scrimp, as it hardly seems to have covered vertically the bunk or siege at which Blair had been sent to work, and certainly left no margin of safety. Blair was given a long stone, about five feet in length, to dress, which stone seems to have extended, when in position on the bunk, fully outside from below the shelter, and it does not appear to have been possible for Blair to put it in any safer position. After Blair had been working under this shelter for eight days, a brick one day, while he was working at the long stone, fell down from the top storey, and, striking something as it fell, went off somewhat at an angle, and struck him on the top of the head, injuring him. He was not able to work for eight weeks, except for a few days, when he tried to work, but found himself unfit. The Sheriff has decided that the main cause of Blair's injury was the fault of defendant or his foreman in not seeing that the shelter put over the hewers was sufficient for the purpose; that contributory negligence has not been sufficiently proved. A sum of 25*l.*, with interest and costs, has been awarded.

The Sheriff adds that it was clearly a failure of duty on the part both of defendant himself, who took personal supervision, as well as of his foreman, not to see that the shelter put over the hewers was sufficient. They undertook a certain amount of risk in having occasionally to go to and fro outside of the shelters; but they were justified in believing that the shelters would be such as to protect them while actually hewing. It was argued that the plaintiff ought to have complained if the shelter was not sufficient; but the master, not he, was the best judge of the insufficiency, as the insufficiency was not so notorious and patent as to be obvious at once to anyone.

## NOTES AND COMMENTS.

THE award of the jury in the competition for the new Exchange Buildings, Amsterdam, was sent in to the Burgomaster and Town Council on Saturday last, and was accepted by them. The numbers and mottoes of the successful designs were published in the Amsterdam evening papers of Monday, the 17th. They are as follows:—Prizes of 1,000 gulden (83½): No. 3. A. G. R. 20. "La bourse ou la vie." 38. Ne(e)derland. 69. The coat-of-arms of the town of Amsterdam, with the motto "Je maintiendrai." 73. Mercaturæ. 83. Perseverance. 91. Ammerack. 106. Lieven de Key. 150. The coat-of-arms of the town of Amsterdam, with the motto "In hoc signo floresco." 172. Y. Of these ten designs the authors of Nos. 20, 73, 91, 150, and 172 were selected to take part in the final competition. Two hundred designs were sent in, nearly the whole of which were hung in the rooms of the new museum. They occupied about 6,700 feet run, and covered about 40,000 feet superficial. The five designs selected for the final competition are all Dutch or Flemish in style, and consist of a mixture of brick and stone, in harmony with the surrounding buildings of the Damrak as regards material.

AN instance of very close tendering lately occurred in Belgium. A municipal building is to be erected at Schaerbeek, near Brussels, from the designs of M. VAN YSENDYCK. The first contract was for the construction of the building. The architect's estimate was 970,000 frs. M. DUBAUX, of Havre (Hainaut), offered to carry out the work for 965,000 frs., while two local builders, MM. SNAPS and MÈGE, were willing to accept 960,000 frs. The furnishing of the building was officially estimated at 126,460 frs. A tender of M. SNYERS-RANG, an agent in Brussels, amounted to 116,785 frs., and one from M. FRANÇOIS, of Etterbeek, to 115,000 frs. It is rather remarkable that a work of the kind did not attract a larger number of offers.

THE opposition to the proposed site for the Liverpool Cathedral has been so strong as to call for the appropriation of a large part of the Bishop's charge to an examination of "the thorny and troublesome topic." Dr. RYLE admits that it is easy to point out the defects of the proposed site; but His Lordship believes that no better site could be found "except by an expenditure in buying up buildings and clearing ground which it is frightful to contemplate." The Bishop admires the site on account of its centrality, being near three railway stations, the Town Hall, clubs, hotels, and leading places of concourse. From His Lordship's words it would seem as if the proposed site had been selected for other than architectural reasons, and that the committee have been attracted by the opportunities which the commercial environment gives to the zeal of the chapter.

ONE of the last works of RICHARD TREVITHICK, the engineer (and, in the opinion of Cornishmen, the inventor of the locomotive), was the designing of an iron tower which was to be a memorial of the passing of the Reform Bill. That project has been excelled by a design which is mentioned in connection with the Paris Exhibition of 1889. It is to commemorate the events of 1789, among which was the assembling of States-General at Versailles, or commencement of the French Revolution. The Paris tower is to be 300 mètres, or over 1,000 feet high. The top will be reached by means of a winding railway. At one time a work of this kind would be considered simply as a memorial, but in these days utility has to be combined. It is therefore suggested that the tower might serve as an observatory, a meteorological station, or a pharos for experiments in electric lighting.

THE apprehension of danger to inventors through the revelation of trade secrets in the proposed exhibition at South Kensington is not widespread. Sir FREDERICK BRAMWELL, the chairman of the Executive Council, was able to state at the Society of Arts on Wednesday, that 85 per cent. of the applications for space were for inventions for which patents had been obtained. When any one can obtain at the Patent Office a copy of a specification containing a description of an invention, the risks of showing the object itself in public may not amount to much. Sir FREDERICK BRAMWELL says that the same objection was made at the time of the exhibition of 1851, and it was found to be groundless.

THE crowds of people who daily pass by the National Gallery must have often wondered at the ugly structure of iron which has been erected in front of the building. It is simply a photographer's operating room, and was placed there to enable Messrs. BRAUN, of Paris, to reproduce the principal pictures in the gallery. The Fine Art Society applied for a similar privilege, but without success. The action of the trustees has not given general satisfaction. The directors of the Society say, with reason, "that to allow at one time a French firm to remove pictures from the gallery, and take away glasses—at another time a German firm to do the same—and in the interim to refuse to permit an English house to remove one single picture from its frame, is not to hold the balance fairly between all parties." It is an advantage that photographers who have been so successful as Messrs. BRAUN should undertake to publish prints from the National Gallery, for by doing so the character of the pictures will become universally known, and from the uniformity of the process the prints can be compared with those which represent the works in other galleries. But, while we admit all this, it is no less evident that an English firm of the standing of the Fine Art Society should have a corresponding privilege. MM. BRAUN's photographs are expensive, the style of them may not satisfy everybody, and copies would not be as available in an English town as those which were issued from Bond Street. In fact, there are so many things to be said in favour of the Society's application, we are surprised that the trustees should have any hesitation in granting it.

THE selection of a site for the Paris Exhibition of 1889 will give rise to much discussion. M. ALPHAND, the engineer of the city, proposes Courbevoie, and he is supported by five members of the Commission. But there are six who are in favour of Vincennes, and two prefer the Champ-de-Mars. Other places have been also recommended. Among them are Saint-Ouen, Levallois-Perret, Aubervilliers, the Bois de Boulogne; and it has been proposed to hold part of the exhibition in the Palais de l'Industrie, and part in some other place.

A REPORT has been presented to the University of Cambridge by the syndicate having charge of the Fitzwilliam Museum. The total cost for building and fittings of the Museum of Archæology has been 9,793*l.* 18*s.* 7*d.*, showing an excess of 993*l.* 18*s.* 7*d.* over the estimated cost. The expenditure for materials of study amounts to 2,335*l.* 9*s.* 11*d.*, thus making the total cost of the new museum 12,129*l.* 8*s.* 6*d.* The syndicate estimate that the annual expenditure on account of the Fitzwilliam Museum will be 1,714*l.*, and for the Museum of Archæology 735*l.*, making a total of 2,449*l.* The income from the Fitzwilliam fund is estimated at 2,869*l.*, leaving a balance of 420*l.* in each year available towards liquidating the debt incurred on account of the Museum of Archæology. The syndicate recommend that the excess of expenditure over the estimate not provided for, amounting to 1,040*l.*, be charged to the Fitzwilliam general fund; that the balance due to the Fitzwilliam reserve fund be transferred to the general fund; and that from January 1, 1885, a sum of not less than 400*l.* be appropriated in each year to the repayment of the debt upon the Fitzwilliam general fund until it is extinguished.

IN addition to the usual courses of Cantor lectures, the Society of Arts announces a course of lectures to be delivered under the Howard Trust, the subject being "The Conversion of Heat into Useful Work." The lecturer is Mr. WILLIAM ANDERSON, who has gained a reputation as a scientific engineer. The first lecture of the course will be delivered on Thursday, the 27th inst., and of the six lectures of which the course consists, three will be delivered before Christmas, and three after it. The following is the syllabus of the first three:—Lecture I., November 27.—Introduction; the laws of motion; potential and kinetic energy; laws of impact. Lecture II., December 4.—Oscillation, vibration, wave motion, pulsation in liquids and fluids; the luminiferous ether; porosity of matter, ultimate structure of matter; heat the consequence of molecular motion; transparency; diathermancy; specific heat; unit of heat; latent heat; absolute zero of temperature. Lecture III., December 11.—Molecular theory of gases; laws of volume, pressure, and temperature; isothermal and adiabatic lines of permanent gases and of vapours; JOULE's equivalent; the doctrines of CARNOT; the limits of efficiency of heat engines.

BLOCK OF HOUSES AND CHAMBERS, BROOK STREET, W.

THROUGH an oversight, the view of the houses and chambers in Brook Street, of which Mr. R. W. EDIS, F.S.A., is the architect, was published with the name of another architect attached. We therefore reprint the plate correctly, and request our readers to cancel the copy given last week. The illustration is a reproduction of a water-colour drawing which was exhibited this year at the Royal Academy.

ST. MICHAEL'S CHURCH, FARNLEY.

THIS building, which is now in course of erection, replaces a small Classic edifice erected in 1761, and known in the vernacular of the district as "t'owd bell chapel," from its only feature of mark, a small circular bell cote over the west front. The site of the church is said to have been previously occupied from remote times by the ancient chantry of the HARRINGTONS. No remains of the earlier buildings are now in existence.

The primary reason for the construction of the new church was the small area of the old one, which was inadequate for the accommodation of the parishioners, and made a change quite imperative. The parish being a poor one it was not possible to erect a building of any pretension, as the great ornament of a tower or spire had, temporarily at least, to be abandoned. Externally the structure is of light brown stone, of excellent quality, with slated roof. It relies for effect, not so much on ornament, of which it has little, as on simple grouping which harmonises well with its position in the midst of the multitudinous graves, picturesquely scattered, of an ancient burial yard, and surrounded by the lofty branching trees separating it from the undulating pasture land of Farnley Park. Internally the church has greater pretensions, though it requires little description, the arrangements being very much of the usual type. The stone dressings used inside are to be of red sandstone, the colour of this lending itself better to future decoration than the cold brown of the local stone would do. The roofs are throughout to be of pitch pine, left untouched by varnish, so as to acquire the rich, mellow tone which age then gives.

The contractors for the building are all local men, and the work is being carried out from the designs of Messrs. CHORLEY & CONNOR, of Leeds.

FINSBURY CHAMBERS, FINSBURY PAVEMENT, LONDON, E.C.

THESE premises are now in course of erection at the corner of Cross Street by the Finsbury Estates Company, Limited. The substructure of the former building on this site consisted of massive walls and arches, forming a portion of the vaults built over a large area of Finsbury Fields by Messrs. WHITBREAD & Co. about the year 1715. The basement of the new premises will have an almost uninterrupted area of 12,700 feet superficial, and will again be occupied by Messrs. A. PROBYN & Co., ale and beer merchants, who will also have some portion of the ground-floor for offices, bottling stores, stabling, &c. On the ground-floor, and facing towards Finsbury Pavement, there will be three shops, constructed fireproof, and the corner shop having a frontage to Cross Street, with show-rooms, &c. In Finsbury Pavement also will be the entrance to the suites of offices which it is proposed to form on the first, second, and third floors. This entrance, through an ornamental stone and granite doorway, leads up to the wide stone staircase to first floor, which on this floor is surrounded by an open arcading. The staircase to second and third floors will be of stone, and 7 feet in width, and lighted by a large lantern light. There is a demand for offices in this locality. It is believed that these suites will readily let at the moderate rents at which they will be offered. The fronts of the building to be faced with best white Suffolk bricks, relieved with Portland and Corsehills stone dressings and granite pilasters.

The contractor is Mr. W. DOWNS, Hampton Street, Walworth, S.E., whose tender, 14,967*l.*, was accepted. The works are being carried out from the designs and under the supervision of Mr. J. W. BROOKER, architect, 13 Railway Approach, London Bridge, S.E.

HOUSE, MAPPERLEY PARK, NOTTINGHAM.

THIS house has recently been built for Mr. O. BARNSDALE, and is situated on rising ground in Mapperley Park, from which an extensive view of the surrounding country is obtained. The house is built of the celebrated Nottingham

pressed red brick, with Ancaster stone dressings, the roof being covered by Broseley tiles. The entrance-hall is laid with MINTON's tiles, and it, as well as the staircase, are surrounded by a pitch-pine dado. The ceilings of lobby and hall are panelled with walnut ribs, and filled in with pitch-pine boarding. A walnut arcading is placed at the foot of staircase, giving a very pleasing effect. All the principal rooms are warmed and ventilated, independently of the fireplaces.

The whole of the works have been carried out by Mr. A. B. CLARKE, builder, from the designs and under the superintendence of Mr. W. A. HEAZELL, architect, Nottingham.

DESIGN FOR TERMINUS OF THE GREAT SOUTHERN RAILWAY OF BUENOS AYRES.

THIS design, originally made for the above building, has been superseded by another possessing all the principal features and details, and which is now in course of erection. The materials proposed were cement facings, cornices, &c., with red tiled roofs. This design was prepared by the direction of Mr. JAMES LIVESSEY, C.E., by Mr. W. C. BRANGWYN, architect, of London.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE second ordinary meeting of the Institute of Architects was held on Monday evening, Mr. Ewan Christian, president, in the chair.

Mr. H. H. STANNUS gave a lecture on the subject of "The Architectural Treatment of Cupolas in General, and that of St. Paul's Cathedral in Particular." He illustrated his remarks by constant reference to drawings, photographs, engravings, &c., exhibited, and sketches on the blackboard.

## The Internal Treatment of Cupolas.

Mr. STANNUS said that he should confine his attention to the consideration of Italian cupolas, or cupolas in Classic style. He wished also to modify the original title of his lecture, and call it "The Internal Treatment of Cupolas." He gave a comprehensive definition of the cupola, which, he said, might be square, hexagonal, octagonal, polygonal, or hemispherical. What he termed an abscissate cupola was a hemisphere with parts cut off, sometimes four, sometimes eight, this latter being very like the cupola of St. Paul's. Mr. Stannus showed a model of the abscissate cupola used by the late Sir G. Scott in his Academy lectures, and lent for the occasion by Mr. J. O. Scott. This formed a cupola with its circumference turned into a square by having four sections cut off. The Byzantine period, Mr. Stannus said, furnished good examples of the abscissate cupola. A penetrated cupola differed from this by being cut into by vaults, after the fashion of a cupola with stilted arches. The depth of the soffit depended on the amount of oversailing of the penetration, and the effect should be studied by drawing them in perspective before carrying out the work. The penetrations should be at axial points. This was not the case at St. Mark's, Venice; but the axial *motif* thus broken into was restored by a set of figures lower down. The same also occurred in an example at Palermo, where figures were introduced between the penetrations or windows. Sir James Pennethorne's treatment for St. Paul's was a penetration, but treated rather as a built-up feature with pilasters and cornices. Mr. Stannus considered also the relation of the cupola with the subjacent architecture, and quoted the cupola of St. Peter's basilica as one that acknowledged every part of the subjacent architecture, and where every axis was recognised by the use of a pilaster. Correggio's work at Parma was an instance of ignored axes. Where piers had to be dealt with, it was a common practice to arch over the space between the piers, as was done at St. Peter's. There were vaultings again the *motif* of which had evidently been furnished by the old Roman aqueducts. Ribs had been much used in cupolas, especially in large cupolas with lanterns, which seemed to demand some treatment suggestive of support. The rib, which was very suitable to give emphasis to a polygonal cupola, provided it were narrow, would be out of place at St. Paul's, because if the hemispherical cupola were thus cut up it would destroy its apparent infinity. There were a variety of rib-treatments, Mr. Stannus said, but he would only call their attention to that at St. Mary Major, Rome, where each rib, to use heraldic language, was cotted, and each pilaster had a half pilaster attached on each side and carried up into the cupola. The effect produced was good, and its great charm was the perfect articulation between the cupola and the subjacent architecture. Sub-panelling was one of the commonest of Italian practices, and ribs carried up into a cupola were connected by circles and panels. The circle from its essentially non-angular form fitted in most prettily in any treatment, and evaded the difficulties that beset other geometric forms. Mr. Stannus pointed to examples of interlacing or intersecting ribs and to stella coffering. This star shape was essentially an Arab treatment. They delighted

in evolving their wonderful devices out of geometric figures. Then there were parallel ribs, a treatment evolved from the construction and form of the cupola itself. Mr. Stannus next referred to the bad effect produced by the artists of former days, who, on a flat surface, painted a magnificent perspective, showing storey upon storey, arches and pilasters piled one above the other, &c. The picture looked well from one point of view. If you moved from that spot everything in the picture was distorted, and produced a most displeasing effect. It was really nothing but scene painting, and quite unworthy to be used in a monumental building. In allusion to the employment of coffers, Mr. Stannus noted the wide field it opened out, and, speaking of the work at St. Bernardino, Verona, characterised it as one of the most perfect types of articulation he had ever seen, and most charming in effect. There was a kind of coffering which might be called "omitted reticulation," a combination of squares forming a network appearance, but with some squares omitted. By this means various beautiful shapes were got. Then there was a treatment of wide and narrow coffers, a stiff treatment: also of rib and coffer, which was very beautiful and thoroughly articulate. Radial figures were next considered. These constantly occurred in St. Mark's, Venice. There was a wonderful impression of solemnity about those great oversailing figures that seem to loom and brood over the spectator from their golden ground. Marginal panels and zones were next described.

Mr. Stannus then referred to a practice associated with the name of Correggio. A painter was in those days esteemed more of than an architect, and the painter thought he had only to stoop to do architecture. But as regarded doing good architecture, these painters were conspicuous rather as examples of how not to do it. It was matter for regret that, in the Sistine Chapel of the Vatican, the architectural lines had not been made predominant. However, it had set the bad example, and others mistook faults for good style and imitated them. The fashion once started increased at compound ratio. The figures had tremendous effect and altogether overpowered the architecture. Fringes of figures, angels' wings, &c., were carried over the ribs on bits of wood. Correggio had done worse than this with his clouds at Parma. Another example was the representation of the expulsion of the angels from paradise in the Church of the Apostoli, at Rome. It was a treatment subversive of all architectural and religious feeling. Decoration to be good should articulate with the architecture. Thus at St. Paul's the features of the subjacent architecture must be considered. Mr. Stannus said the decoration should be original, appropriate, and serve to emphasise the axes of the cross. It should suit the gradual unfolding to the eye as the spectator walked up the nave. Mr. Stannus considered the cupola then in regard to the architecture, and ran over various treatments of ribs plain and intersecting, coffering, radial figures, marginal panels, zones, all of which were unnecessary, unsuitable, or objectionable. Axial panels, with figures, he said, might do. Coming to the circle, Mr. Stannus said it was the section of a sphere, and of a sphere only, and was the one only figure suited to a cupola. Stevens adopted circles as the main feature of his design. The ribs came as a later introduction. Circles were characteristic of imaginings and of visions, and had this advantage, that however much other geometric figures were distorted, as seen from different points of view, the circle could never become distorted; at the worst it only became an ellipse. Then there was the gloom and the distance of the lofty interior to be considered. Simplicity of form and colour was found to be all important. Gold was essential; the gold permeating everything for the sake of continuity, and to avoid the plaque appearance. Nothing else could give the cupola so noble and grand an appearance. Cockerell had suggested that if bright colours were put up one might lose that distance, but he (Mr. Stannus) said if we lost colour and got more gold the atmosphere of mystery would be preserved; the mystery of Heaven, not the mystery of darkness. As to scale, Thornhill's design dwarfed everything, whereas Stevens's version preserved scale, and even increased it. Three years back he (Mr. Stannus) conceived that circles were the right thing, and that ribs might be omitted; and since his version of Stevens's design had been up in St. Paul's the ribs had been criticised: hence he had ventured to produce the design he had made three years back, but which had never been seen till that evening.

The rest of Mr. Stannus's remarks regarded the matter of storiage, and, in conclusion, he said his thanks were due to the Dean of St. Paul's, Mr. Penrose, and other gentlemen for drawings, &c., lent for the occasion, particularly to the Dean of St. Paul's for lending Stevens's model of the cupola, then exhibited in public for the first time.

Mr. H. H. STATHAM proposed a vote of thanks to Mr. Stannus. Mr. Statham considered that Wren would have discarded the idea of the peristyle, and, consequently, carrying out the decoration of the dome in special reference to it. There was a floating rumour that the actual dome was coffered before Thornhill painted it. This was not improbable, and the state of the original model almost implied that Wren had contemplated it. Most of them, however, would dismiss the idea of coffering from their minds as a commonplace treatment for a great dome. Next, should the lines of the pilasters be strongly marked by ribs? To treat a circular dome

with ribs was manifestly wrong, however fit for octagonal domes; nor would broad ribs do in an octagonal dome. His (Mr. Statham's) opinion still was, that to strongly accentuate the dome, to destroy its unbroken surface, would be more or less to take away its impression of immensity and grandeur, and make measurable the characteristic which Mr. Stannus had called its greatest glory. If it were granted that they should not divide the dome up with these strong vertical lines, what were they to put there? Mr. Poynter's painting, he thought, was one of the finest and most expressive that had ever come from a painter's hand. He went to St. Paul's to examine it *in situ*, but it could not be seen except from the Whispering Gallery, and he came to the conclusion that it was a mistake to put pictures in the dome that depended for effect on telling a complicated story. There was one idea as to the decoration of domes. Mr. Burges's scheme approached nearest to it, and it had never yet been fairly carried out. No pictures requiring anything like a close examination should be put up, but something grand yet simple, easily to be grasped and not depending for effect on the special play of the countenance in the figures, &c., all which would tend to dwarf the architecture.

Mr. J. P. SEDDON seconded the vote, and said that the dome had been left by Wren one vast, unbroken, sublime, and grand vault. No other architectural features should be added to what it originally was. The only decoration should be painting or Mosaic. Sham attics, orders, ribs, &c., would be intolerable. The dome was quite out of sight of the nave; it was no use considering one-half of it, as it was not so seen. If painted the decoration should be free both from archaic conventionalism and lawless fancifulness. The introduction of ribs, tangential circles, &c., would necessarily produce a confusing effect in the dome, which was not that of a Gothic but of a Classic building, and therefore required an exactly opposite treatment, by, for instance, the use of zones. The scheme by Burges, involving a sham, was wholly indefensible. Thornhill's work disturbed the dome comparatively little, and moreover had the right of possession. Botticelli's picture in the National Gallery was an example of what would be almost exactly the right thing both in subject and in execution.

Mr. E. ARMITAGE, R.A., said the difficulty arose when figures were introduced that you must make them of different sizes to fill large and small panels, otherwise it would produce overcrowding. Seen from below, it gave the impression of being a section of an exhibition gallery, showing a lot of different-sized pictures arranged together higgledy-piggledy, instead of giving one the grand idea of a dome. Whatever might ultimately be done, he should always advocate the putting in of ribs or divisions as a grander treatment for the dome. This might be united with Mr. Burges's design without introducing archaic or Byzantine figures. Mr. Armitage condemned the principle of making eight sections of the dome, and pointed out insuperable difficulties in painting figures with that design. The dome was extremely dark, and only in bright summer weather could anything be seen there; so, whatever subject might be chosen should be of the most simple character, flat tints and a gold background and white figures, with a grand outline which the eye could and would follow. Modelling of figures would be perfectly wasted. In this way, and if the rest of the building were decorated in accordance with it, we should feel we had got a suitable treatment for the dome.

Mr. J. D. CRACE said the object of the rib treatment had been overlooked. Since the earliest and most noble domes showed this treatment there must be a reason for it, and the reason was that ribs could alone explain the vertical section of the dome. Zones could not. Botticelli's dome, treated in zones, was really a niche. He endorsed what Mr. Armitage said as to figures. Some part of a dome was nearly always in bright light. You saw gold brilliantly, but you did not see variations of colour. The rib treatment had not had a complete or just trial, for the reason that none of the vertical ribs were undisturbed. At St. Peter's, where the dome was divided by ribs, the main vertical lines were absolutely undisturbed; not interlaced with anything, and the circles were kept quite clear of them. Mr. Stannus's circles, on the contrary, touched the ribs.

After some remarks from Mr. W. White, the discussion of the subject was adjourned on the motion of Mr. Aitchison, A.R.A., seconded by Mr. E. Woodthorpe.

## THE RESTORATION OF WESTMINSTER HALL.

THE Select Committee of the House of Commons appointed to inquire into the plans for the restoration of the exterior of Westminster Hall sat at Westminster on Wednesday. Mr. Shaw-Lefevre took the chair, and there were present—Mr. W. H. Smith, Mr. Walter, Lord Randolph Churchill, Sir R. Wallace, Sir H. Holland, Sir E. Reed, Mr. Dick Peddie, Mr. Cheetham, Mr. Rylands, Sir John Lubbock, and Mr. Beresford-Hope.

Mr. Shaw-Lefevre said he proposed to call Mr. Pearson, the architect whom he, in his capacity as First Commissioner of Works, had consulted, and then to ask the Committee to inspect the site of the suggested buildings. It would then, perhaps, be as

well if hon. gentlemen returned to the committee-room where, if necessary, other questions could be asked of Mr. Pearson. Upon the conclusion of Mr. Pearson's examination he would call Mr. Taylor, one of the surveyors of the Board of Works, as to the condition of the walls and the possibility of their lasting in their present condition any length of time. Whenever the Committee decided to continue their investigations he should ask Mr. Dick Peddie to call any witnesses he might have in opposition to the scheme which had been for 'some time before the public. He had received a letter from Mr. Barry, son of Sir Charles Barry, saying that he wished to lay before the Committee his father's views on the subject, and he had informed Mr. Barry that there was no doubt that the Committee would give him an opportunity of expressing his opinions. He had also letters from several of the leading architects of the day expressing their views on the matter, but he thought he should hardly be justified in calling them as witnesses unless Mr. Pearson's views were seriously impugned.

Mr. Pearson, R.A., said he was invited by the Government to advise them as to the restoration of the west front of Westminster Hall. He was acquainted with the construction of many public buildings, having devoted considerable attention to the old architectural styles. The Dean and Chapter of Westminster had employed him to carry out the repairs and restoration of Westminster Abbey, and he had been engaged on the work for four or five years. Since he was invited by the Government to advise them on the restoration of the west front of Westminster Hall he had spent much time in working out the structural antecedents of the building, and in preparing the plans with which the Committee had been supplied. He began by investigating the foundations of the adjoining building, and these and the remains of other foundations which he had discovered agreed in a remarkable degree. Mr. Pearson described the character of the architecture of the Hall, and declared that the architectural styles of the Norman, Richard II., and Tudor periods were to be found there. His investigations confirmed his opinion that there was a double-storeyed cloister with flying buttresses erected in the time of Richard II., and also a building at right angles to the northern side of the western front, a building which was in Queen Elizabeth's time used as a music-room, but in later times as the Court of Exchequer. He proposed to restore the exterior of the building to what he considered was its original condition. He would erect a double-storeyed cloister, the lower one having open arches and the upper one having windows very much of the same character as those in the main building. The upper storey would be reached by stairs leading from the Hall. He had prepared a plan with a single cloister, but he did not recommend its adoption. The open storey might be used as a carriage approach to the Hall. His proposal consisted of four parts—first, the construction of a double-storeyed cloister under the flying buttresses; secondly, the erection of a building at right angles to the Hall, on the site of Queen Elizabeth's music-room; thirdly, the raising of the tower at the north end of the Hall; and fourthly, the completion of Sir Charles Barry's work—the Houses of Parliament—at the corner of St. Stephen's Porch. The cost of the cloister part of the scheme, including the building at right angles with the Hall, would be 21,000*l.*; the cost of completing Sir Charles Barry's work, 5,000*l.*; and the cost of adding to the tower on the north front, 8,800*l.* The cost of repairing the wall and buttresses would be 8,000*l.* The result of carrying out his plans would be that they would get a chamber 31 feet by 27 feet, a stand for horses, four large rooms in the upper part of the cloister, and three in the tower.

Mr. Shaw-Lefevre asked whether it had been the intention of Sir C. Barry to raise the tower.

Mr. Pearson replied in the affirmative, the object of Sir C. Barry being to bring the Hall into harmony with his buildings. The views of Sir C. Barry on this point should be carried out. It had been the intention of this architect to erect a new wing to the Houses of Parliament in front of Westminster Hall, shutting in that edifice from view, but it would be most undesirable to carry out this plan. The sight of Westminster Hall against the more florid work of Sir C. Barry was most valuable from an architectural point of view. The broad, unbroken roof and the general breadth of the Hall was a foil to the intricate and delicate work of Sir C. Barry—it was a centre of repose in the picture. Most old architectural remains showed the work of various periods. The effect of the Hall as seen from a distance, if the cloister were not constructed, would be most unsightly. It was not common for buttresses to stand attached to a building with nothing under them—in fact, he only knew of such a thing in the two cases of the chapter-houses of Westminster and Lincoln. On some of the stones of the wall of the Hall the marks of the Norman masons were to be seen, but, if the Hall was left in its present state, would soon disappear, the stone being soft and incapable of resisting the action of the air. If, however, a cloister were constructed in front of the wall, the stonework could be left intact. As to the windows of the building, he should be sorry to see them lengthened, as it would involve the destruction of the arches, which dated back to the time of Richard II.

Upon the return of the Committee, Mr. Pearson, replying to Mr. Rylands, said that in the event of the lower cloister not being used, it would be impossible to lower the ceiling of that cloister in

order to give greater height to the roof above. If only one cloister were erected, the importance or dignity of the Hall would, in his opinion, be diminished. His great object in the plans he had prepared was to preserve the historical interest of the building. In answer to Mr. Dick Peddie, Mr. Pearson said his instructions were to prepare plans for the preservation of the walls and buttresses, and in making his investigations he was struck with the original design.

Mr. Taylor, an architect, and one of the surveyors of the Office of Works, said the wall of Westminster Hall now exposed to view was composed of several kinds of stone, and his impression was that if the wall were left exposed, having been covered for so long a time, it would very soon crumble and decay.

The Committee afterwards adjourned to the 21st inst.

## THE INDUSTRIAL ARTS OF INDIA.

THE following letter from Major Keith, C.E., late Assistant-Curator of Indian Monuments, appears in the *Times*:—

The Government of India have voted five lakhs towards the South Kensington Exhibition of 1886, and with a view of resuscitating the industrial arts of India. All friends of the Indian artisan will wish success to the undertaking, although the most sanguine may well doubt whether the revival of Indian art is anything more than a vain dream. There are several inherent causes leading to decay, and they are beyond all remedy; while there are others equally fatal, but susceptible of being remedied. With your kind permission I should like to offer a few reflections on the subject. (1) An age of costly magnificence has long been superseded by a utilitarian one, when men build for the passing decade, not for posterity; nobles no longer construct magnificent places of pleasure resort, to be converted into still more superb places of sepulchre at death; (2) with the decay of native courts many an art and industry perished; (3) rajahs are now more than apathetic on the subject; and (4) the masses with whom a taste for the beautiful in art once existed are no longer leavened with a love of it. Occasionally the village coolie may still be seen decking his mud hamlet with arabesque and fresco; but it is merely a vestige of that taste which once impregnated all classes in India. On the other hand, a great deal may be done by way of conserving the few industries that still struggle for existence, if the ruling classes could only be aroused to take an interest in the matter. At the same time the energetic Secretary to Government for Agriculture and Revenue, aided by Dr. George Watt, who is a host in himself, will require to be quick if the few surviving industries are to be rescued. Every year adds to the death-roll of the purely traditional arts. An annual visitor to Delhi, it was only last summer that I observed how the seal engravers in the Dareeba had perished, a race of men whose performances might favourably compare with the best work turned out by Messrs. Strongitharm, of Pall Mall. Other towns have similar experiences. In Gwalior I tried to unearth and rescue several industries, but no sooner had I partially succeeded than an evil genius interposed, and by a negative procedure brought about a collapse of the work and severed me from work to which I wished to devote my remaining years. The money I had collected for a museum to assist impoverished workmen by making it an agency and registry of their work has been spent on purposes I never intended; the initial exhibits I had prepared for the museum were retained at Calcutta instead of Calcutta supplying itself with duplicates; and finally, the stone-carving industry, the revival of which I had tried to embody in the "Gwalior Gateway," now lying at South Kensington, is likely to be relegated to obscurity by my enforced retirement from Gwalior. I am unable to offer any explanation touching the miscarriage of honest endeavours for the relief of starving workmen in Gwalior. Possibly my offence lay in bringing inadvertently to notice the fact that there were starving workmen there. I fully expected that the Maharajah Scindia would have thanked me, but this he never did, nor did he offer me the slightest personal encouragement during the years I was in Gwalior. I had endeavoured to bring the stone-carving industry to notice, numbering as it does some 2,000 workmen, chiefly unemployed, and to find work for these poor people, but unsympathising ignorance determined to strangle the effort. It will be said that the Maharajah Scindia gave so much money for the "Gateway," but it was in the interests of his subjects that I proposed it. I myself never got a farthing of remuneration, although I devoted months in the height of a central Indian summer towards the undertaking. A sufferer both in health and pocket, I have some reason to complain. Those who wish to see what Indian carvers can do, may do so by visiting South Kensington. Without any technical training an urchin barely twelve years of age will, by simple eye-sketching, trace out the most delicate arabesque, and this with rare fidelity, his only pencil being a rough piece of charcoal. After this he will carve it with the utmost delicacy and incisiveness. One great mistake we make in our relations with Indian art and industry is to treat India in the same way as we treat our own country or the colonies, where there was no indigenous art. We still flood it with Europeans who are supposed to teach men far more capable of teaching them. The

native is not a born administrator, but a little conventional training will make him an admirable architect, engineer, &c. It is certain that much of the work done by European agency could be very well carried out by natives. A contention like this is sure to provoke opposition, but it is no less true.

Probably the most discouraging factor in the revival of Indian art and industry is the apathy of the Anglo-Indian community. It may be very desirable to seek European markets and aid from without, but unless a movement is started from within the attempted revival will not be a success. On the part of trades unions, Birmingham designers, Manchester, and many other interested parties there will be a determined opposition against any extensive introduction of Indian ornament and design. And yet India deserves some compensation for the wholesale injustice done to her weavers and print-makers by the premature introduction of free trade and the unjust retention of a protective duty on foreign imported silver into England. I have remarked that it is almost a dream to predict any general revival of Indian art, but I feel convinced at the same time that if all collectors followed the excellent example set by Mr. Growse, C.I.E., of Bulandshahr, and Mr. Coldstream, of Lahore, much good may be attained. These gentlemen have zealously endeavoured to promote indigenous art, and until their example is more largely followed little good may be anticipated. A great deal can be done through the medium of local exhibitions and museums, provided the governing classes throw aside their insularism and isolation, placing themselves more in accord with the sympathies of the people. Hitherto their example has been of a baneful kind, seeing that they encourage all sorts of incongruous forms of architecture. Their want of example was demonstrated at the Calcutta Exhibition last year, where barely a fraction of the official class, who constitute the aristocracy of the country, attended, and a still smaller fraction purchased exhibits. Most of the leading rajahs, such as Scindia, Holkar, and Cashmere, were conspicuous by their absence. The exhibition was in no sense a national one, nor did it fulfil its duties as an educator of the people. This was more to be regretted seeing that it was very popular with Bengalees, male and female. Possibly the failure of duty on the part of the official class is an outcome of a growing detachment between races, which constitutes a real internal danger to the country. This isolation is not the product of the Ilbert Bill, but of an age which witnesses weekly steamers from England, telegrams, parcel posts, and an annual exodus to Simla. The popularity of the old Indian of a former day arose from his living among the people, spending more than a tithe of his income upon them, and largely sympathising with whatever gave them joy and pleasure. His wife shared his sympathies and anxieties. All is now changed. The lady either lives in Simla all the year round, or lives separated with her family in a villa at home. All Indian subjects are now voted a bore at messes and clubs. To take an interest in the manners or customs of the people, or to venture a stray remark about archæology, &c., is to expose one's self to a rejoinder after the fashion of Dr. Johnson, who declared that he did not wish to hear any more about the second Punic war. No wonder if a superlative in Simla was shocked at a room in Government House being furnished with Indian material, or at the president of an industrial committee in Delhi proposing to obtain tools from England to teach some of the finest carvers to be met with anywhere. Until this feeling is reversed it is hopeless to expect any revival of art in India.

## THE CITY COMPANIES.

### 2. The Carpenters' Company.

A BROTHERHOOD or guild of carpenters is believed to have existed in London about 1350, but under what circumstances is not recorded. The first charter to the present company was granted in 1477, 17th Edward IV.

Edward IV., by charter (dated July 7, 1477), granted to certain freemen of the mystery of carpentry of the City of London, that they or any of them might establish a brotherhood or guild within the City to remain for ever, to consist of one master, three wardens, and commonalty of freemen of the mystery of carpentry abiding in the City of London, and the suburbs and precincts of the same, and of the brethren and sisters of the freemen of the said mystery, and of all others who of their devotion will be of the same brotherhood or guild; and that the same master, wardens, and commonalty should be one body and one commonalty, incorporated by the name of Master, Wardens, and Commonalty of the Mystery of Freemen of the Carpentry of the City of London. And further, that the said commonalty, that is to say, the freemen of the mystery, might, whensoever they would, choose and make of themselves, according to the ordinance by them to be made, one master and three wardens, to transact the business of the mystery, brotherhood, and guild, and to oversee, rule, and govern the same, and all persons appertaining to the mystery within the City of London; and the wardens and commonalty were authorised to make ordinances for the good rule and government of the same mystery. This charter was exemplified, ratified, and confirmed by Philip and

Mary (a Charter of Inspeximus), and also by Elizabeth, the latter exemplification being dated November 8, 2nd Elizabeth.

James I., by charter (dated July 15, 5 James I.), granted to the master, wardens, and commonalty of the mystery of freemen of the carpentry of the City of London, that they should exercise the powers of search, correction, and government of all the freemen of the art or mystery of carpenters of the City, or using or exercising the said art or mystery within the said City or the suburbs of the same, or within two miles thereof, together with powers for the inspection of timber, and regulation of matters relating to the trade.

Charles I., by charter (dated July 17, 16 Charles I.), reciting the preceding charters, and that various frauds and deceptions were practised in the trade, granted to the master, wardens, and commonalty of the company, that the master, wardens, and assistants for the time being, to the number of twelve or more, of which the master and wardens for the time being to be four, being met together upon summons to be made for that purpose, should have full power and authority to appoint, constitute, and make ordinances, decrees, and constitutions in writing for the good rule and government of the master, wardens, and commonalty of the mystery, and of all other persons being free of the art or mystery, or using the same art or mystery within the City of London, or liberties of the same, and for declaring in what manner the master, wardens, and commonalty, and all such persons as aforesaid, should behave themselves, and use the occupation of the said art or mystery.

Charles II., by charter (dated October 20, 26 Charles II.), reciting and confirming the preceding charters, granted, upon the humble petition of the master and wardens of the company, the oversight and government of all and singular persons, whether freemen of the said mystery, or using or occupying the same within the City of London, or within four miles of the same, together with very extensive powers and privileges for exercising the oversight, search, and measurement of all and all manner of timber, timber stuff, and materials, and the works and workmanship thereto within the before-mentioned limits.

These powers had been already restricted by Act of Parliament, 1666; for, besides a renewal of the prohibition of timber buildings, backed by such a convincing argument as the Great Fire afforded of its necessity, the City were to appoint surveyors to inspect the buildings; whereas all buildings, at least as far as concerned the timber used in their construction, had previously been under the surveillance of the Carpenters' Company.

James II., by a charter (dated March 19, 2 James II.), granted to the Carpenters' Company (upon the surrender of all their powers of nominating and electing the masters, keepers, or wardens, and assistants, and clerk of the company), re-incorporated them by the name of Masters, Keepers, and Wardens and Commonalty of the Freemen of the Mystery or Art of Carpentry of the City of London. One master and four wardens were appointed to hold office until the second Tuesday in the month of August then next, and from thence until others should be elected, pursuant to the power therein contained. And it also granted that they should have twenty-two assistants, named and appointed to continue in office during their natural lives, or until removed for lawful cause. And it is declared that whensoever any masters, keepers, wardens, or assistants should die or be removed from office, that then and in such case another fit person or persons should be elected and chosen into or to the place or places of the person or persons so dying or being removed or displaced by such person, and in such manner and form as thereinbefore were used in the company for the space of seven years then past. The charter is entered in the books of the company, but with a memorandum of its having been revoked by the Statute 2 William and Mary. In 1666 an Act of Parliament was passed ordering brick buildings in place of wood, and all carpenters, &c., not freemen of the City employed in the building were, for the space of seven years, to be allowed the liberty of working as freemen, and all who should so help for seven years were to enjoy the same liberty for their lives. In 1693 an Act of Common Council was passed by which all persons carrying on the trade of carpentry in the City of London were compelled to bind their apprentices to the Carpenters' Company.

In its origin the Carpenters' Company was a brotherhood or friendly society, and gradually became a trades guild for the protection of the trade, and by its charters had committed to it the overlooking of buildings in the City of London and suburbs, in order to prevent bad workmanship and the use of bad materials. In the early part of the seventeenth century viewers were chosen from the Carpenters' Company for that purpose; but after the Fire of London, in 1666, it was supposed that a bricklayer would be a better judge of buildings then erected than a carpenter, and though others were afterwards appointed, the Building Act of 1774 removed the duties of the viewers to district surveyors, who now do the work originally entrusted to the Carpenters' Company, though as a friendly society or guild it still continues and exercises its functions, and fulfils the trusts committed to its charge.

The company have a license to hold property in mortmain, "dated the one and thirtieth day of July, in the two and thirtieth year of the reign of Charles the 2nd." The license provides that all lands then held were to be considered the property of the

company, and they were empowered to acquire land of the additional value of 200*l.* per annum. These powers have not been exceeded.

The company possesses no right of exercising superintendence over, nor has any duty or discretion to encourage in any way, any art, trade, or business. The Act of 1774 invested all supervision and control of buildings in the City of London and its suburbs in the hands of district surveyors, and deprived the company of all control it formerly enjoyed in such matters.

The governing body of the Carpenters' Company consists of a master, three wardens, and Court of assistants, all of whom have served previously the office of master or warden in accordance with the charters, and according to by-laws and ordinances approved by the lord treasurer and justices of either Bench on the petition of the master and wardens.

The master and wardens are elected by the livery of the company annually on the second Tuesday in August, having been first nominated by the Court. The qualifications are, that those nominated must be liverymen of reputable character, and have always paid 20*s.* in the pound to their creditors. In almost every case, if otherwise eligible, the senior warden is elected to be master, the middle or renter warden becomes senior warden, the junior warden becomes middle warden, and the senior liveryman, if eligible, is elected to the office of junior warden.

The master presides at all the meetings of the Court, and pronounces their decision on all matters which are brought before them and on which a vote is taken. The wardens assist the master in the general business of the company, all of them attending to pay the pensioners. The two junior wardens also attend to receive the rents quarterly, check the vouchers of expenditure, visit the almshouses, and make due inquiries about applicants for relief and for admission to the freedom and livery of the company. No fine is taken on admission to the Court; the members are paid no salary, but receive fees for attendance. The master and wardens receive no extra fees for their services, but are only paid the same as the other members of the Court.

The ordinary business of the Court is attending to bind apprentices, admit to the freedom and the livery, to order pensions or relief to poor members or their widows, to discuss all questions as to the letting and management of the property, and to give such orders as may be necessary for the management of the charities committed to their care. They also visit the estates periodically, and annually visit the almshouses both at Twickenham and Godalming, for which attendances no fees are given. The Court meets on the first Tuesday in every month, except September, and at such other times specially as may be necessary from press of business. The votes of the members are taken by show of hands, and minutes of the proceedings are taken and kept by the clerk, which are read at the succeeding Court, and are always accessible to any member of the Court.

In one of the ordinances, signed by the lord chancellor and others, power is given to the master and wardens to expel from the fellowship, but no case of suspension or removal is recorded as having taken place for the last eighty years. There are no by-laws sanctioned by the courts of law, but all orders are made by the governing body, who have full powers to regulate, in all respects, the affairs of the company.

There are two classes of members, viz., liverymen and freemen. Females are entitled to the freedom either as widows or daughters of freemen. The freedom may be obtained by patrimony, by servitude, or by redemption. In the two former cases the fee to be paid is 3*l.*, the stamp duty being 1*l.* If admitted by redemption the fee is 15*l.* 15*s.*, the stamp duty being 3*l.* In this latter case a form of application has to be filled up, signed by two householders; inquiries are made by the wardens. The candidate must be proposed by a member of the Court and balloted for, and a majority of two-thirds is necessary for election.

The company have no power to compel persons using the art or mystery of carpentry in the City of London and suburbs to become free of the company. Anyone entitled, either by patrimony or servitude, can claim the freedom. There are, and always have been, members of the company who are carpenters, and many others indirectly connected with the trade. At the present time the number would be nearly one-fourth of the members.

There is no rule or process at present in existence for the disfranchisement of freemen. The number of the livery is limited to 150 by an order of the Court of Assistants. All applicants for the livery have to get a form signed by two householders similar to that for the freedom. If the warden is satisfied as to the respectability of the candidate, he is proposed by a member of the Court and balloted for. The election rests with the master, wardens, and Court of Assistants, and a majority of two-thirds is required. A liveryman may be removed for gross misconduct. If a liveryman fall into reduced circumstances and petition the Court, his livery fine is returned, and he is struck off the list of the livery and becomes eligible for a pension. The fee for admission of a freeman to the livery by patrimony or servitude is 35*l.*, and by redemption 52*l.* 10*s.* The freedom of the City of London is not a condition precedent to becoming a freeman of the company, but all freemen of the company must be free of the City of London before they can become liverymen.

In the event of a freeman or his widow or children falling into necessitous circumstances, and applying for assistance, the case is considered and inquired into, and, if found deserving, the freeman or his widow is granted 14*l.* per annum, or (if both be dead) his children 10*l.* each per annum. They are also eligible for admission into the almshouses at Twickenham. A liveryman is usually invited to be present at three entertainments given by the Court during the year. If a liveryman fall into necessitous circumstances his livery fine is returned, and he, or (in case of his death) his widow, would be placed on the pension list at 40*l.* per annum, or his children, if necessitous, at 20*l.* per annum each.

The master, wardens, and Court of Assistants have a fee of three guineas for attendance at the business courts, which usually occupy three to four hours. A fee of one guinea is given for attendance on any special committee, and the warden, on his monthly visits to the almshouses, receives 8*s.* for his expenses, but no fee for his services. The average amount for the last ten years paid to the Court in fees for managing the affairs of the company has been 807*l.*

### THE GAMBETTA MEMORIAL.

THE Gambetta Memorial competition has been decided. The design submitted by M. J. P. Aube, sculptor, and M. Boileau, architect, has been accepted. It consists of an obelisk with two large figures, representing Truth and Force, and Gambetta in the centre of a group. He stands, while a genius is unfurling a flag and flying forward above his head, and the soldiers around him are inspired with renewed courage at the sound of his voice. One of them, who had dropped his sword, is in the act of picking it up. At the summit is a female figure symbolising the Republic, seated on a lion, and holding in its hand the Declaration of the Rights of Man. Long extracts from Gambetta's speeches will be engraved on the base. The monument will be erected in the Place du Carrousel, between the two wings of the Louvre. The jury also awarded a prize of 6,000 frs. to the model exhibited by M. Dalou and M. Faure Dujarrie. The second prize of 4,000 frs. was carried off by M. Falguière and M. Pujol, and awards of 2,000 frs. each were given to M. Allard and M. Dutert, M. Coutan and M. Lambert, and M. Injalbert and M. Laloux. The exhibition of the models at the Ecole des Beaux-Arts will remain open till December 2.

### THE GREEK TREASURE TROVE CASE.

THE case of the three Greeks who were in possession of two pieces of sculpture contrary to the laws of Greece (see *The Architect*, Nov. 8) was again heard at the Thames Police Court on Tuesday. Mr. St. John Wontner, who represented the Greek Government, said he attended in the hope that the question of ownership would be decided. The magistrate would remember that information was furnished to the Greek Consul in London that two statues of great value had been brought into this country. The Greek Government were entitled to claim, under the laws of Greece, statues of this description which were found in or had been taken out of the country. When the prisoners were arrested a document was found on one of them relating to a judicial inquiry which was held in Greece with regard to the finding of a statue. From inquiries that had since been made, the Greek Government were quite satisfied that one of the statues found in the possession of these three men was the same concerning which the inquiry had been held. That Government was also satisfied that this particular statue was not an antique one, but of modern make. Such being the case, all claims on the part of the Greek Government now ceased. With regard to the other statue the head was undoubtedly antique, but its value was so small that he was directed by the Greek Government to withdraw all claim to that. Although the case was now ended in this country, the three men would be answerable to the Greek Government on their return to that country for taking away the statue. According to Greek law, supposing they did not intend to return, their property, which each one of the three men possessed in Greece, would be made to answer the charge. Under these circumstances he would ask the magistrate to order the restitution of the statues to the three men.—Mr. M. Abrahams said it followed from what Mr. Wontner had stated that the three men had been wrongfully charged with being in the unlawful possession of these things. They had also been kept in prison for seven days, and he might mention that they intended to seek redress from the proper quarter for that unlawful imprisonment.—Mr. Saunders said the only question now for him to decide was what was to become of the statues. He had written an elaborate judgment on the subject in case he should have been called upon to deliver it. However, after what Mr. Wontner had stated, there was now no occasion for him to deliver it. He was quite clear in his own mind that he had a right to order the statues in question to be given up. At the same time he might mention that he quite agreed with Mr. Wontner that they were not genuine antique statues. Although perhaps not a fraud, it was a piece of chicanery on the part of some persons who brought the statues over to England to sell as

genuine antique ones. On referring to the London Police Act, he found a clause especially dealing with this subject, by which it was quite clear to his mind that the officers of justice had things merely placed in their custody pending the direction of the court. It had been said that the statues were worth 15,000*l.* That might be so, but all he could say was that he should not like to give that sum for them. He should now make an order for the delivering up of the statues to the three men.—Mr. Abrahams observed that the statues were found by the father of the two farmers, and they were afterwards given them by their mother as a portion of their inheritance.

### LIABILITY OF SANITARY ASSOCIATIONS.

**A**N action was brought some time ago by Mr. Ainslie, of Elvingston, Haddington, against the Sanitary Protection Association of Edinburgh, to recover 500*l.* damages for depreciation of his property. Mr. Ainslie in the early part of the year entered into negotiations for letting on lease his mansion-house of Huntington; and while these negotiations were going on the house was visited by Mr. Thomson as one of the engineers of the Sanitary Association, and its drainage and water storage arrangements inspected without Mr. Ainslie's consent having been asked or obtained by the defenders. He contended that the whole inspection was hasty and careless, and stated that a communication on the subject had been made to the party who was negotiating with him for a lease of the house, which had the effect of greatly depreciating the value of the property, besides putting him to considerable expense. The defendants maintained that, as the plaintiff had had sanitary defects remedied in the house since the inspection, so far from sustaining loss by reason of the examination and report, he had substantially benefited thereby, and stated that, since the sanitary arrangements were improved, a lease has been taken of the mansion-house for five years. The defendants further contended, in their second plea of law, that the plaintiff's statements were irrelevant, and insufficient to support the prayer of the petition. The Sheriff-Substitute sustained this second plea, dismissed the action, and found the plaintiff liable for costs. An appeal was subsequently taken to the Sheriff-Principal, and Sheriff Davidson has now dismissed the appeal, and found the plaintiff liable for additional costs. In the course of a note his lordship says:—"The case is not now being dealt with on its merits, but it may be observed that, even on the pursuer's statements, the place could hardly have received a better character and certificate than from the report of Mr. Thomson, followed, as the Sheriff was informed, by the execution of the works which he recommended. The pursuer is fortunate in the case being arrested before further expense is incurred."

### The Architectural Diploma.

SIR,—I think Mr. Mardon Mowbray's suggestion of a memorial to the Institute hereon, as expounded in *The Architect* of Nov. 8, is one which should meet with the support of all architects desirous of maintaining the dignity of their profession. Undoubtedly every architect should possess a diploma of efficiency, and illiterate and unqualified persons be debarred by legislature from practising, and (only too frequently) bringing dishonour on the profession.

The Institute should have power to confer diplomas at once, not only on its own members, but on all architects who have been in independent practice for a certain number of years; and, for the future, let the embryo architect (1) give evidence, before entering his articles, of his having received a good general education; (2) let him be articled in the usual way for a term of five years, and at the expiration of say three years of that time let him be required to pass an elementary examination in architecture; and (3) at the completion of his articles let him pass his "final" examination (framed possibly on the lines of the present obligatory examination of the Institute), and receive his diploma of competency to practice.

Yours faithfully,

ALFRED W. CROSS, A.R.I.B.A.

Memorial Buildings, Hastings:  
Nov. 13, 1884.

### Awards for Ventilators at the Health Exhibition.

SIR,—In reply to Mr. Clark's letter *re* the above, which appeared in your current issue, we have only to repeat that we were *not* invited to send our air-pump ventilator, which is the only exhaust ventilator we either manufacture or sell, for the purpose of being tested, nor were we notified that tests were being made with exhaust ventilators; we, as already stated, not being even aware that such tests were instituted until after they were completed and the awards made. Under these circumstances it

seems rather superfluous for Mr. Clark to say that we were *not* excluded from the testing, seeing that we—why, we cannot understand, though we mean to find out—were left in entire ignorance of the existence of such tests. Mr. Clark states that we were invited in *proper* form to send our ventilator to be tested, and also that he holds a letter from us declining to comply with his request. As this is really a matter of not only private but public interest, we now call upon Mr. Clark to publish the letter referred to, so that your readers may be enabled to judge between us, and that we may have the opportunity of showing how we have been treated.

With respect to our error in the length of the testing tube, stating that it was 8 feet, whereas Mr. Clark informs us it was 10 feet long, this additional length instead of improving the position shows all the more conclusively that the mode of testing was a *farce*, and we are prepared to argue this point with Mr. Clark either as a question of science or practice, or as both, and to prove the correctness of our assertions, which we make as practical men of extended experience. From the accounts we have since read of the experiments, and the manner in which they were conducted, we much fear that they will have the effect of bringing sanitary science into discredit with the public, and do it almost as great an injury as the notorious "Kew experiments," which is greatly to be regretted, as it retards and hampers the efforts which earnest and practical men are now making to popularise the cause amongst the people.

We derived the information from a credible source that the shafts of the ventilators tested were *inside* the tube, but as Mr. Clark affirms, and we have no knowledge of ourselves to the contrary that such was not the case, we will concede the point, which does not affect materially the method of testing the ventilators.

As we in the whole course of our experience as ventilating engineers have never heard mention of Mr. Clark as an authority on ventilation, it might, as indicating the value to be attached to that gentleman's labours, be satisfactory to your readers, as it certainly would be to us, to be informed of his qualifications to decide a question relating to ventilation in such an offhand manner, which has hitherto baffled the most scientific and practical experts on the subject, *viz.*, the determining by *scientific experiment* the relative values of ventilating cowls. We would strongly recommend Mr. Clark, and all others who feel inclined to dabble in such experiments (?), to carefully read and digest the article on "Cowl Testing" which appeared in your issue of the 1st inst., and if they then do not see the fallacy of their attempts to solve what is practically as difficult a problem as squaring the circle, we fear their case is hopeless.

Mr. Clark stigmatises part of our letter as "abusive." If stating that we will not allow this matter to drop until we have sifted it to the bottom, and discovered the individual or individuals really to blame is "abuse," then we admit the impeachment; or if our remark that the experiments in question are a reflection on the intelligence of the nineteenth century be considered "abuse," then we again admit the impeachment.

In view of Mr. Clark replying to this letter, we beg to ask him one question, and that is, if Mr. J. P. Seddon, architect, who, we are informed by the secretary to the juries, formed one of the jury on ventilation, is a friend of his, or if he is personally acquainted with that gentleman? Your readers will doubtless comprehend our reasons for asking this question.

As we presume we may look upon Mr. Clark's letter as a final reply, so far as the jury are concerned, to our letter of protest addressed to Sir Philip Cunliffe-Owen in his capacity of official representative of the jury, and receipt of which that gentleman duly acknowledged, we herewith beg to append that letter as showing how the matter stands.

Queen Anne's Buildings, 64 Holborn Viaduct,  
London, E.C.: Nov. 4, 1884.

To Sir Philip Cunliffe-Owen, Secretary to the late Health Exhibition,  
South Kensington.

DEAR SIR,—We are informed, and for the first time, that the exhaust-ventilators exhibited at the late Health Exhibition, South Kensington, have been submitted by the jury to a series of tests, with the view of ascertaining which was the best and entitled to the first prize. As we received no notification that such tests were going to be made, nor were we invited to submit our self-acting air-pump ventilator, exhibited at the Health Exhibition, for the purpose of being tested along with the others, we beg to ask you, as the representative of the jury, for an explanation of the omission, and the reason for our ventilator being excluded.

We have also to ask you if it is correct that Mr. J. P. Seddon, architect, formed one of the jury on ventilation, and that five medals have been awarded to the ventilating and sanitary appliances of a firm which that gentleman has been the public advocate of for these last seven years, he being also well known to be strongly antagonistic to us personally and to our ventilating arrangements?

During the time of the exhibition we repeatedly attempted to ascertain the names of the jury; but, for reasons best known to that body, none of their names were allowed to be divulged—an unprecedented proceeding and entirely contrary to the recognised rules which control all exhibition juries. We beg to remark, however, that in England men do not submit to be condemned by secret tribunals without even having been brought to trial, as is the case with us in the present instance.

We would also like to know why the jury have awarded us a silver

medal for an appliance which we did not exhibit at all, namely, our system of ventilation for drains? The limited space granted us prevented us from doing so.

We beg also to ask if the official list of awards as published in the *London Gazette* correctly represents the value and number of the prizes awarded to each exhibitor, as we observe a paragraph in this week's issue of the *Building News* which states that Mr. W. P. Buchan, a plumber in Glasgow, has been awarded a gold medal, whereas in the list he is shown as having only received a second prize (silver medal) for traps and the lowest prize (bronze medal) for ventilators?

Enclosing a pamphlet containing the notorious Seddon correspondence re the application of our system of ventilation to the London Custom House, and hoping to be favoured with an early reply to the foregoing queries,

We have the honour to be,

Your obedient servants,

(Signed)

ROBERT BOYLE & SON.

P.S.—We beg formally to protest against the awards given for ventilators, on the grounds that our self-acting air-pump ventilator was not tested, and that we were not invited to submit it for the purpose of being tested along with the others, and that therefore the awards given do not show that the ventilators receiving them were just'y entitled to them.

R. B. & S.

As it is evident, from the position Mr. Clark has taken up, that the above letter has failed in its purpose, and that we may expect but scant satisfaction at the hands of the gentlemen—whoever they may be—who formed the jury, we will now appeal to the executive through its head, His Grace the Duke of Buckingham.

Our letter to Mr. Clark will be a partial reply to Mr. Banner's, which appeared in your current issue. We have now to say that, had we known at the time that Mr. J. P. Seddon formed one of the jury on ventilation, we should have lodged a formal protest against his acting in that capacity, on the grounds that he was declaredly antagonistic to us, and that he was also the advocate of another system of ventilation (Mr. Banner's), upon which he would also have to adjudicate. Had we been invited to send our air-pump ventilator for the purpose of being tested, which we were not, and had we been aware that Mr. Seddon was one of the jury, we should most certainly have declined; and it has yet to be explained why the names of the jurors were kept so strictly secret in spite of all our attempts to ascertain them.

With respect to the value of the tests, we have already, through the medium of your columns, expressed our opinion, and that opinion we not only maintain but are prepared to prove is correct. As to the efficiency of Mr. Banner's or any other ventilator as compared with the air-pump ventilator, there is no surer or more crucial test than the test of time, and no better judge than the public. It is not for us to boast of how long our ventilators have now been in use, nor of the number of buildings, public and private in almost every country in the world, which we have successfully ventilated, nor of the almost incredibly large number of ventilators which we have sold during the last fourteen years. The fact that they are known and extensively used in every quarter of the globe is in itself, we think any reasonable and unbiassed person will admit, sufficient proof that the air-pump ventilators have been found to satisfactorily answer their purpose, or they would not have been so generally adopted. But that is not all. We recently made an appeal to the principal architects in the United Kingdom, to be favoured with their experiences of our ventilating appliances, and we received, in *immediate response*, over four hundred most valuable testimonials, amongst which are to be found the names of almost every leading architect in the kingdom. We humbly think that the testimony of gentlemen who all speak from extended practical experience, such as Mr. Arthur W. Blomfield, Mr. Arthur Cates, the late Sir Gilbert Scott, Sir William Thompson, Dr. B. W. Richardson, the late Professor Macquorn Rankin, &c., &c., will have a little more weight with the public than the pottering experiments of a few amateurs whose ideas on the subject are possibly as vague as their practical knowledge is limited. Mr. Banner is simply making a farce of a serious matter when he again offers his bellicose challenge to "single combat" for 100*l.* a side, &c., &c. Considering that he has now offered this challenge to almost every ventilator maker in the country, and we believe has been also himself challenged, we should have thought that by this time he would have seen the folly of his conduct, and the ridicule he was bringing on the cause of sanitary science by his treatment of it as if were the "prize ring." If Mr. Banner, who, we believe, notwithstanding his pugilistic predilections, to be in his capacity, as a city merchant, a most estimable gentleman, and who must have spent a great deal of money in the indulgence of his hobby, is so very desirous that his name should be handed down to posterity as one of the great sanitary reformers of the present age, let him, instead of giving away his 100*l.* in the way he proposes, expend it in applying his system of ventilation gratuitously to one of our City hospitals or homes, and then invite his friends and the press to witness what he has done. We can assure him that, if he does this, he will accomplish his desire, and at the same time have done a good deed, which will be doubly satisfactory. With respect to Mr. Banner's latest challenge, we have only one thing to say to him in the meantime, and that is to adopt our recommendation to Mr. Clark, and carefully read and digest the article on "Cowl Testing" which appeared in your

issue of the 1st inst. If, after reading that he should still remain in the same frame of mind as he is at present, we will then, with a clear conscience, be in a position to reply further to him.

We are, yours truly,

ROBERT BOYLE & SON.

64 Holborn Viaduct:  
November 15, 1884.

SIR,—Will you spare us a small space for once in your journal in order that we may point out the statements that are likely, unless contradicted, to mislead your many readers, made by Messrs. Banner Brothers & Co. in their letter in *The Architect*, November 15, 1884, pages 324-325, and also to refute their assertions on some other points outside the question of the testing invitations.

We, in short, emphatically deny having any notice or communication from anyone in authority that such test was about to take place, nor did we know anything of it at all until one gentleman, a competitor, came to us. Two questions require answering on this point: first, how is it we were omitted? Considering the exhibit we had (the only one in the whole exhibition which showed ventilation in its practical form) we are making inquiries at headquarters into the matter, and we hope to have explained to us, and to our satisfaction, the cause of such treatment. Can it be said our exhibit was no compliment to the International Health Exhibition, and no notice was required? If so, we must appeal to some of the many who honoured us with their visits, not omitting gentlemen members of the press. Secondly, were Messrs. Banner Bros. assured by anyone in authority that invitations had been sent to all exhibitors to contest? If that is a fact, as stated by them, we not only contradict that assurance, but challenge the truth of it. Therefore it is clear on the face of it Messrs. Banner Bros. have said more than they were justified in doing, or they have been misinformed. Having laid our case before a gentleman of authority and unrelenting energy, we wait with patience his report.

As Messrs. Banner Bros. have called into question the opinion of all ventilator makers, we suppose we must come under that distinguished title. As to the tests, we do not give our opinion in favour of them. We believe that a greater farce was never committed by anyone who took upon himself to act in such a capacity, and if Messrs. Banner Bros. are the great authorities in ventilation they assume, surely they must confess their ventilator, with the elaborate construction and working parts, cannot be of much account, considering they were beaten by at least two, with no working parts at all, the one a chimney-top, the other a simple 9-inch tube, with two cones outside for the wind or air to act upon, which could have no effect when tested, for the reason that the testing was carried out in a room; and we give it as our unbiassed opinion, under such circumstances, no other result could have been expected, and we will now give in detail a few remarks in justification of our opinion, and leave them to be contradicted by anyone who is able.

All fixed or rotating cowls or ventilators are represented as being automatic. If a visit is made to Messrs. Banner Bros.' stand, and an explanation is asked, it will be the wind or air acts so and so, which causes the ventilator to act so and so. Take the one that claims the highest award for fixed or roof ventilators (the silver medal), because the maker asserts that the winner of the gold medal obtained it for an Albert chimney-top. His is a plain, open tube, with cones outside for the wind to play upon, causing an induced current. This is his exact description when explaining it, and so it is with every one. Atmospheric agency is what is relied upon. At any rate, so it is declared by the recipients of awards. Take the system applied in the testing, called the correct one, and see if the atmosphere had anything to do with the merits of the ventilators so fortunate. We say it had not, and, scientifically, we shall be uncontradicted, for the reason that all the results were brought about by a forced current. Thus, it is quite clear that Messrs. Banners' cowl would be better without any parts at all except the repeat shaft. If their judgment is correct as to the method of testing, could the result be otherwise? Take, for instance, a 9-inch tube, with 500 cube feet of air being forced through it every minute; take another, with the same amount of pressure, place a straw or anything else that occupies space, and the result must be different; hence it is, What value is there in fittings or appliances to a ventilator, against one without any, particularly under such a method of testing as before named? If Messrs. Banner Bros. are right, and we are wrong, the ventilating engineering profession will seem to be a thing of the past, as any one can have a perfect ventilator by taking an old hat with the crown out. What is to beat it? There you have a clear circumference the size of the hat, and no obstruction to the forced current by any internal appliances that are so frequently (and not without profit) used. We could most unquestionably give many other reasons why we differ from Messrs. Banner Bros., and also why we consider the test so applied does not give the relative merits of a ventilator, and the result of such tests are calculated to seriously mislead the public, who have had no opportunity of seeing the various ventilators that are in the market, and more especially because the testing was carried out by an authority

connected with the International Health Exhibition of 1884. Considering the importance of the exhibition, the benefit that not only exhibitors but the outside world expected to derive from the exhibits and the verdict of the judges, they should have been such as to have given reasonable satisfaction. If Messrs. Banner Bros. are correct in stating that Messrs. Robert Boyle & Son were invited, and there is documentary evidence to prove it, and Messrs. Robert Boyle & Son publicly declare they had not an invitation, we ourselves declare we had no invitation. Messrs. Banner Bros. inquired—and we suppose of the proper authorities—if all had been invited, and were assured they had. It is for your readers to be informed where this tremendous discrepancy lies. As far as we are concerned, we hope Messrs. Banner Bros. rather misunderstood the reply to their inquiries. If not a responsibility rests upon someone, who will best vindicate their actions by an announcement open to your readers. We hope you will excuse the length of our letter, and favour us with space for the purpose of setting forth a true state of the case as far as we are concerned.

2 Elmhurst, Upton Lane, Upton, E.: Yours truly,  
November 19, 1884. EDGAR ALDOUS & SONS.

SIR,—I beg to express my regret that there should have been any reason for Messrs. Robert Boyle & Son writing as they do. They complain of not being asked to send in their ventilator to be tested along with the "select" number that have been tested. Now I complain of being put to the expense of sending one of my ventilators all the way from Glasgow specially to be tested, and of no proper testing being made. This is not the first time I have made this complaint, however, as owing to being up in London at the Plumbers' Congress at the International Health Exhibition on October 20, I called at the room where the "testing" was being made on the morning of the 21st ult., and from what I saw I considered the mode of testing quite useless, and therefore wrote a letter that same evening objecting to the tests, which letter was received by the secretary of the exhibition on October 23, some days before the awards were published, and before I knew how my ventilator exhibits were to be judged.

The pseudo-testing of the ventilators, so far as I saw, was made in a (for the purpose) small room 12 feet high and about 22 feet long and 18 feet wide, with window extending fully 3 feet further. For testing, two fans were used with 8½-inch diameter outlets, each being worked by a man turning a handle or crank, just as if turning a grindstone. These fans were set on a table several feet above the floor, and delivered the air from them into a wooden tube 10 feet long, the nearest end of tube to fans being about 3 feet back from fans, which caused the other end of the tube to be only about 5 feet distant from the solid wall. The tube was nearly square in section at end next the fans, being 3 feet high and 2 feet 6 inches wide. At the end furthest from the fans the tube was 5 feet high.

The ventilator being tested rested on the bottom of the wooden tube, which latter had a hole cut in its bottom below the pipe of the ventilator, to allow the air in and the application of the anemometer. The size of the tube was much too small, while its distance from the solid wall was far too little. Instead of only being five feet from the wall, it should have been about five times five. As it was, the artificial wind could not get forwards to the front of my ventilator, but was deflected off at each side and also over the top. The volume of wind produced by the fans was too little, and the size of wind tube too little also for my 22-inch ventilator.

We were asked to send in a ventilator for a 9-inch pipe, without any information as to how the testing was to be made, &c., and I concluded to let my 22-inch one take its chance.

With the testing, as conducted, I would have had a better chance with a small 15-inch ventilator and a tapered pipe than a 22-inch one. One might as well set a six-days' Atlantic liner to run a race with a tug-boat in a farmer's duck-pond as test one of my 22-inch ventilators in a small room, as above described.

It would be very interesting to know the comparative results given with the above style of testing, as then any two "tested" in the room could now be properly tested by exposure to the wind above a roof. I intend to have this done with Messrs. Banner & Kite's as soon as I can manage it, and publish the results. At the same time, I consider that injustice has been done to all the exhibitors of ventilators by the testing being attempted—I cannot say carried out—as described, while the public, in my opinion, are liable to be misled. The judges have awarded to my ventilating exhibits a bronze medal for exhaust ventilators, but if any higher award has been given for *exhaust* ventilators *per se* to any other exhibitor, I beg to openly protest against it.

I am, &c.,  
W. P. BUCHAN.

[This letter was held over from last week in consequence of the length of other letters.]

**The First Stone** of the West Ham Police-court, Stratford, E., was laid on the 12th inst. by Mr. G. Rivett, Chairman of the Local Board. Mr. Lewis Angell, F.R.I.B.A., is the architect, and Messrs. M. A. Palmer & Sons the builders.

## GENERAL.

**An Exhibition** of the works of M. Jan Van Beers, the painter, is now open at the Cercle Artistique, Brussels. The King of the Belgians lately spent two hours in the gallery.

**The Winter Exhibition** of the Birmingham Art Circle opened on Monday.

**M. Gérôme** has obtained a commission from the King of the Belgians for a large picture representing the inauguration of the statue of *William II.* at Luxembourg.

**The Wolverhampton Art Gallery** has been reopened, and contains the loan collection of pictures shown at the lately-closed exhibition.

**The New Gallery in the British Museum** containing the sculptures of the Mausoleum is now open to the public.

**Mr. H. H. Armstead, R.A.**, has obtained the commission for the statue of Lieutenant Waghorn, the pioneer of the Overland Route, which is to be erected at Chatham.

**The Museum of Carcassonne** has been presented with the cartoon for the large picture by M. Cormon, *Return from a Bear Hunt in the Stone Age*, which was exhibited in this year's Salon.

**Mr. George A. Lawson, Sculptor**, has been elected an honorary member of the Royal Scottish Academy.

**A Social Meeting** in connection with the Midland Arts Club, Birmingham, was held on Wednesday evening. Among the works of art exhibited was a fine Gainsborough portrait of *John Wilkes, Lord Mayor of London*, lent by Mr. William Henman. Mr. J. A. Cossins showed his design of the Liberal Club, and Messrs. Henman & Timmins their design of the Conservative Club, and a seal of the Guild of the Holy Cross, date 1345, was lent by Mr. Joseph Hill.

**M. Chaplin** has been invited by the Comte de Paris to spend some time at the Château d'Eu, in order to paint portraits of the young princesses.

**The Death** is announced of Mr. Frederick William Hulme, the landscape painter. The artist, who was a Yorkshireman by birth, settled in London about forty years ago, since which time he has been a regular exhibitor at the Royal Academy and the British Institution. His principal works were *The Close of Day*, *Sermons in Stones*, and *Rest*, respectively exhibited at the Royal Academy in 1870, 1873, and 1874.

**A Society of French Artists** is about to be formed, which is to have for its end the emancipation of French art from "the oppression of juries."

**A Fund** for the restoration of Audlem Church has been started. The proposed work is estimated to cost about 3,000*l.*

**A Memorial Communion Table**, designed by Messrs. Chorley & Connon, of Leeds, has been placed in Millhill Chapel, Leeds, by the widow of the late Alderman J. D. Luccock. The table is of oak and walnut, elaborately panelled, and is the work of Mr. J. W. Appleyard, of Leeds. The panels are of enamel mosaic, the figures being in colour on a gold ground, done by Mr. A. Cappello, of Chelsea.

**M. Ernest Renan** has been elected an honorary member of the Society of French Antiquaries, which was founded in 1829. It consists of forty-five members and ten honorary members, and the meetings are held in the Louvre.

**Plans** have been prepared by Mr. Cundall, of Leamington, for the erection of a parish building in connection with the church of St. Nicholas, Warwick. The cost is estimated at about 1,400*l.*

**Acting** on the recommendation of the Works Committee, the Metropolitan Board of Works have decided to apply to Parliament for power to construct two steam ferries across the Thames at Woolwich and Greenwich. The cost of the ferries is put down at 350,000*l.*

**King Charles of Roumania** has given an order to MM. Damon & Cie., of Paris, for the decoration and furnishing of the new palace at Bucharest.

**The Marquis of Bute** has arranged to sell the Bute Docks at Cardiff, with the railways and rolling stock, to the Taff Vale Railway Company. The value of the property is about 3,000,000*l.*

**The Railway Station at Gloucester** is to be enlarged. It will be necessary to remove the goods shed and lines further east, which will be a work of considerable magnitude.

**Professor Carl Vogt, the Naturalist**, has lent for exhibition to the Athenæum of Geneva, several of the oil pictures painted by himself, and comprising Alpine landscapes, hunting scenes, &c.

**Mr. William M'Ewan**, of Edinburgh, has promised to contribute 5,000*l.* for the internal finishing and equipment of the new University Buildings, on condition that 10,000*l.* will also be subscribed by Michaelmas 1885.

**The Gaiety Theatre** at Southampton was destroyed by fire on Wednesday morning.

**"Richard II."** has been produced at the Theatre Royal, Berlin, in a magnificent style. The scenery was arranged by Herr Eichelhäuser. Schlegel's translation of Shakespeare's tragedy has been adopted.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, NOVEMBER 22, 1884.

### EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

### TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—  
“Contract Supplement to THE ARCHITECT.”

Brown & Young, Glasgow . . . 24,010 1 8  
Osborne & Pearson, Kilmarnock . . . 23,921 17 9  
Ross & McArdrey, Belfast & Dundalk . . . 23,485 0 0  
SMITHSON, Dublin (accepted) . . . 22,992 13 8  
Ten other tenders were received ranging from 25,000l. to 38,376l.

## EAST GRINSTEAD.

For the Erection of Aerated Water Manufactory. Mr. S. W. HAUGHTON, Architect, East Grinstead.  
Godly, East Grinstead . . . £203 6 0  
Quickenden, East Grinstead . . . 180 0 0  
Pledge, East Grinstead . . . 175 10 0  
Charwood Bros., East Grinstead . . . 165 0 0  
Morris, Ashurst Wood . . . 160 0 0  
BEARD, East Grinstead (accepted) . . . 146 0 0  
For the Enlargement of the East Grinstead Dispensary. Mr. S. W. HAUGHTON, Architect, East Grinstead.  
PLEDGE, East Grinstead (accepted) . . . £117 1 0

## FLINT.

For Alterations and Additions to Town Hall, Flint. Mr. LOCKWOOD, Architect, Chester.  
HUGHES, Alford (accepted) . . . £890 0 0  
Stone Staircase . . . 75 0 0  
HUGHES (accepted) . . . 75 0 0

## FOXFORD.

For Ventilating Schools at Foxford.  
Haywood, jun., Coventry . . . £105 0 0  
Lester, Coventry . . . 87 0 0  
GOODE, Foxford (accepted) . . . 83 0 0

## GOSFORTH.

For Construction of Sewer, with Manholes, Ventilating Shafts, &c., South Gosforth. Mr. C. J. BAFF, Surveyor.  
Alexander, Gosforth . . . £308 9 11  
Gordon & Smith, Gosforth . . . 225 9 5  
Elliott, Sunderland . . . 218 17 1  
Middlemas Bros., Newcastle . . . 218 14 6  
Keegan & Keenan, Newcastle . . . 211 8 2  
Turner, Newcastle . . . 207 5 2  
ROBSON, Newcastle (accepted) . . . 200 2 3  
Craigs, Gateshead . . . 199 18 4  
Stockoe, Fence Houses . . . 196 7 8  
Tangton & Sedgwick, Dipton . . . 195 15 0  
Carr, Hexham . . . 195 5 1  
W. & M. Young, Jarrow . . . 191 6 7  
Dixon, Fence Houses . . . 188 10 6  
Simpson, Newcastle . . . 187 14 2  
Tyrle, Gateshead . . . 186 5 3

## GREAT YARMOUTH.

For Carpenter's and Joiner's, Plumber's, Glazier's, and Painter's Work to Shop Front, King Street, for Mr. B. Thompson. Mr. C. G. BAKER, Architect.  
Salmon . . . £105 0 0  
Barnard . . . 104 10 0  
Want . . . 92 5 0  
Cooper . . . 89 15 0  
Cork & Beech . . . 89 8 6  
Rand & Cooper . . . 79 15 0  
All of Great Yarmouth.

## GREENWICH.

For Rebuilding 35 and 37 Church Street, Greenwich, for Mr. W. B. Blackman. Mr. R. W. CRAWLEY, Architect. Quantities supplied by Messrs. Hills & Fletcher.  
Forrest . . . £1,994 0 0  
Jarrard . . . 1,990 0 0  
Hall . . . 1,875 0 0  
Redman . . . 1,825 0 0  
A. & F. Smith . . . 1,754 0 0  
Hubble & Trott . . . 1,749 0 0  
HOLLOWAY (accepted) . . . 1,747 0 0

## HULL.

For Sinking Four Artesian Bores at Springhead Pumping Station, Hull. Mr. D. MAXWELL, Engineer.  
Vivian & Co., Whitehaven . . . £3,400 0 0  
Fennell, Leytonstone, Hull . . . 2,623 0 0  
Tilley & Sons, London . . . 1,997 11 0  
Batchelor, Luton, Kent . . . 1,800 0 0  
Villiers, Beverley . . . 1,600 0 0  
SMALLEY, Hull (accepted) . . . 1,080 0 0  
Speck & Co., Hull . . . 955 0 0

## LEWISHAM.

For Alterations at the Black Bull Public-house, Lewisham, for Mr. G. Shaw. Mr. H. T. BONNER, Architect.  
HOLLOWAY (accepted) . . . £975 0 0

## HUDDERSFIELD.

For Building Junior Department, Mount Pleasant Schools.  
Lockwood, Huddersfield.  
Moorhouse & Sons, mason . . . £2,890 0 0  
Wood Bros., joiner . . . 1,117 0 0  
Mellor & Crowther, plumber . . . 347 0 0  
Calvert & Co., hot-water . . . 332 0 0  
Pickles Bros., tiler . . . 291 10 0  
Heaps & Co., ironwork . . . 235 0 0  
Longbottom & Sons, plasterer . . . 106 0 0  
Bevers, painter . . . 65 0 0

## JARROW.

For Paving and Channelling at High Street and Hope Street, also for Excavating and Bottoming Don Street, Hope Street, and Derby Street, for the Sanitary Authority. Mr. J. PETREE, Borough Surveyor, Jarrow.  
McKay . . . £530 10 10  
Adams . . . 453 1 1  
Scott . . . 346 0 0  
Maughan . . . 328 13 8  
CALLAGHAN (accepted) . . . 326 14 0  
All of Jarrow.

## KING'S LYNN.

For Building Stables, Provender Stores, &c., King's Lynn. Mr. E. G. MAWBEY, Architect. Quantities by Borough Engineer.  
Brown . . . £1,291 12 3  
Lofts & Sons . . . 1,229 7 4  
Bennett Bros. . . . 1,114 8 9  
Fayers . . . 1,110 18 7  
Leach, jun. . . . 1,106 13 7  
Thing & Spragg . . . 1,059 7 8  
Foreman . . . 1,049 0 0  
Dye . . . 1,045 16 1  
Daves . . . 1,015 0 0  
BARDELL Bros. (accepted) . . . 995 0 0  
Architect's estimate . . . 997 0 0

## LEICESTER.

For Construction of Main and Storm Overflow Sewers, Dame Hill District, Leicester. Quantities by Mr. J. Gordon, Borough Surveyor.  
Stevenson, Eckington . . . £5,548 11 10  
Nash, London . . . 4,580 0 0  
Ward, Leicester . . . 4,500 0 0  
Russell & Co., Eltham . . . 4,165 0 0

GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

TESTIMONIALS.  
"9 Victoria Chambers, Westminster, S.W.  
"June 10, 1884.  
"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.  
"Yours, &c.  
"JAMES WEIR, F.R.I.B.A.  
"To Mr. Grundy."  
"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.  
"February 15, 1884.  
"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.  
"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.  
"Mr. John Grundy."  
Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.  
Works—TYLDESLEY, near MANCHESTER.

# The Architect.

## THE DECORATION OF THE DOME OF ST. PAUL'S.

HE adjourned discussion which is appointed for Monday evening next at the Institute of Architects may possibly—in spite of something like a rule to the contrary which unfortunately seems to operate in such cases—bring out some new views of criticism; and, in connection with a subject of such unusual interest, we hope it may; but we need not defer offering a few remarks upon the treatment of the question at the last meeting, even if we have to refer to the matter again. For, in fact, the general drift

of thought upon an exceedingly delicate artistic problem has already been sufficiently developed to enable even those who are comparatively uninitiated, not merely to understand the scope of the proposals, but to follow the consideration of their principles.

Six rival ideas have been brought forward up to the present time, which may be designated as follows:—(1) Ribbed work; (2) coffered work; (3) columnar-work; (4) arched work; (5) panel work; and (6) vault work.

It must be clearly borne in mind uninterruptedly in this discussion, that the problem is how to decorate, by painting, the smooth surface of a hemispherical interior cupola about 100 feet in diameter, and 220 feet high from the floor to the crown; that there is at the crown a small open eye; and that the whole concave is lighted very dimly from below. It has also to be observed that the "subjacent architecture" is a peristyle of thirty-two columns, with a plain unbroken entablature. One other circumstance that may in some degree affect the question is this: the crux below being octagonal in disposition, the peristyle above is likewise *octagonalised* by filling in with close panels the eight intercolumnar spaces which stand at equal intervals over the eight supporting piers; the interspaces otherwise, twenty-four in number, being occupied by open windows.

As regards the effect of the lighting upon any work of decoration in the concave dome, we must further note that the windows of the peristyle, immediately underneath, constitute eight triplets or groups of three, left as yet in the glaring white glass of Philistinism, whereby they "try the eyes" very much; while the opening at the apex is practically worse than useless, being bright enough, not to illuminate the vault, but only to render it difficult to see what may be painted, even in gold. Lastly, the hazy atmosphere of the City of London may be taken into account.

It is manifestly a fundamental question whether the decoration of such a cupola is or is not to proceed upon architectural principles. If it is to do so, then perhaps the best of all courses to pursue is to place in considerable relief upon the surface of the hemisphere the requisite rib-decoration or tracery, and then to finish with painted work upon this basis. But no one proposes to do this. Whatever is proposed to be done is to be done in painting alone.

There are, as the next step, more ways than one of using painting. One way is to paint some sort of express imitation of architecture; and it is probably right to say at once that this, although there are many precedents for it, including the original and extant decoration, is essentially a barbarous way. Painted architecture has never been satisfactory, and never can be. But at the same time it is quite possible to adopt something of the character of an architectesque arrangement for the leading features of the decorative composition; and, provided this were carried out strictly in the flat—without either "modelling" or shadowing—it might be satisfactory enough.

The first of the six rival principles above mentioned, that of simple ribbed work, is splendidly exemplified in the case of St. Peter's at Rome. We see it on the outside of the dome of St. Paul's, and indeed of most other domes. The circumference is divided into regular intervals, and converging ribs ascend directly from the base to the summit, leaving long narrow triangles of flat surface between them, which in an in-

terior dome are left for panelling or painting. This mode of treatment, however, ought properly to be always carried out in relief; and it ought still more properly to constitute, as in Gothic vaulting, the actual construction of the vault, being scientifically one of the two elementary ways in which a dome may be built. In St. Peter's there are sixteen of such ribs, corresponding with sixteen couples of columns in the peristyle below; in St. Paul's there would probably have to be thirty-two, because the columns are not coupled. If planted on the surface in relief, these ribs might at the worst represent a magnificent cage-roof beyond which the vault of heaven might be filled with ethereal figures; but if to be painted on the flat, as a framework for figures which would probably stand between them one over another in a too solid representation of flesh and drapery, the idea would probably be discarded by most of us without further debate.

Secondly, coffered work may be described as reticulated panelling covering the whole surface in any one of various recognised patterns. The noblest example of this is in the Pantheon at Rome, the ancient hall of the Baths of Agrippa. Here thirty-two vertical ribs rise from around the base and converge upon the eye at the crown, while horizontal ribs cross them at such intervals as to form square panels; the relief is very massive and the effect simple and grand. The Pantheon at Paris, or church of Ste.-Geneviève, has its dome coffered in a similar way, only that the square panels are slightly octagonalised; but here the "eye" of the dome is large, and exposes an outer or super-cupola beyond, which is painted in figure-groups and sufficiently well lighted. In St. Paul's the adoption of coffered work, if painted on the flat, would be after the manner of inlay, and in bright mosaic, chiefly gold, would no doubt have a grand effect of a purely architectesque character. But something more striking than this is evidently desired.

The term columnar-work we are applying to all ideas of decorative painting which involve the representation of colonnades, arcades, and other such architectural compositions. Of this order the existing painting in St. Paul's dome by THORNHILL is a conspicuous illustration. Taking for his points of departure the eight closed interspaces in the colonnade below, he has carried up from each of these a couple of tall columns with a piece of entablature over them, and eight arches span over the narrow intervals thus left at the summit. The work of painting then takes the form of a continuous figure picture receding behind the colonnade, or eight panel pictures framed by the colonnade. The objection to this mode of treatment is plain: a continuous story-picture is out of place, and indeed out of sight, in such a situation; eight panel pictures are quite as much so; and the painted architecture is in principle entirely absurd, even if its difficulties of perspective were not almost ludicrous. In the design which the late Mr. BURGESS prepared, the architectural mode of treatment was still accepted, which may surprise many of the admirers of that very accomplished artist; but it has only to be remembered how completely Mr. BURGESS was wrapped up in academical precedent, and the reason becomes plain. His principle, however, was that of the Byzantine arcade, not of the Renaissance colonnade; and the effect was that of work in concentric circles, or in successive storeys—suggestive, by-the-by, of another plan for dome construction, namely, the ring-system, which indeed is better than the rib-system.

The fourth mode of the six above named, or that of arched work, has been quite recently proposed to be applied to the St. Paul's problem in a grand way by Mr. WYLD. It is that which is called by Mr. STANNUS the "abscissate principle," and in actual dome-building it belongs chiefly to the East. A hemispherical dome is intersected by two barrel vaults standing at right angles with each other, both of less diameter than the dome necessarily, but springing from the same level. The result is that the upper portion of the dome seems to be a segmental vault carried upon the crowns of four semicircular arches, which is then continued downwards on the same curve in the four triangular spandrels or pendentives between the arches. Mr. WYLD proposes to paint upon the St. Paul's dome four great semicircular arches of this sort, to put into each semicircle a grandiose figure group, and to finish with a ring of figures above. The most striking objection to this plan is that the *four* abutments of these great arches and the *eight* close spaces of the peristyle cannot be brought into accord except by placing each of the four abutments over the centre window of one of the eight triplets; which is weak in

effect. Moreover, there must be some difficulty in accounting for the four great arches themselves if the question be put—What could they represent in the way of structure?

Here we may refer to the circumstance that the great architect of St. Paul's certainly seems to have had in his mind in designing the dome the angular element as distinguished from the circular. The lantern which crowns it externally is not round but square on plan. The piers of the crux are disposed on an octagon. The peristyle under the concave vault is broken up to correspond with this octagon. THORNHILL'S painted architectural framework again corresponds, being itself a make-believe octagon in perfect form. What may have been the personal intentions of Sir CHRISTOPHER WREN with reference to the decoration of the dome many of us seem to be unable to guess. It is scarcely possible that so graceful an intelligence as his undoubtedly was could have failed to take the subject into consideration; and it is not to be supposed that his plain vaulted surface was meant for anything else but painting; the chances are, therefore, that he contemplated exactly what was done, namely, that a painter should design the work in his own way, which would of course at that time be upon some academical Renaissance model. That WREN'S intentions ought to govern the artists of our own day, however, is not at all a matter of course, and it is somewhat surprising that so much should be said about them by critics who ought at least to feel that the whole system of his time in such decoration was a thing that is not worth following now. All that need be seriously said with regard to WREN'S decorative intentions seems to be this—that the artist who was capable of objecting so emphatically to the obscuration of his chancel by "a d—d box of whistles" was not at all likely to be an advocate of the ultra-evangelical bareness of absolutely plain stonework for the ceilings of so grand a temple of Christian worship. How far he would himself have gone in the direction of picture-paintings we need not inquire; but he most assuredly could not have wished posterity to neglect the opportunity, when it should arise, of making the edifice, within rational limits, "all glorious within."

### THE PERMANENT AND THE TRANSIENT IN ART.

IT must have been often remarked that pictures which represent incidents of modern life assume a sort of antique character in the course of a short time. This is no less true of drawings and engravings of similar subjects. The *Ramsgate Sands* and *Railway Station* of Mr. FRITH may be taken as examples. They are supposed to have been faithful records of contemporary life; but hardly a generation has elapsed and the world finds that it has little relation with them. Whether this transformation arises from the accuracy with which fashions of dress have been depicted, or from something peculiar in the subjects themselves, may give rise to discussion; but about the estrangement between the spectators and the pictures there can be no doubt. It may be asked why pictures by WILKIE and MULREADY are taken from modern life, and yet retain their hold on the public? But neither artist cared to exhibit the fidelity of Mr. FRITH; and the costumes, surroundings, and details will not bear the tests that can be applied to his works. A more remarkable instance will be found in the sketches by JOHN LEECH, which may be said to reflect the English people of his time. Their value as historical evidence of manners and costume will increase; but what is thought of them by the young ladies of the present, who are so charmingly drawn by Mr. DU MAURIER? Are not the cheerful, comely, crinolined figures declared to be "frights"? If Mr. TENNIEL'S fame depended on his illustrations to stories which were written in days when men wore "peg-tops," his surprising power of representation would avail but little.

In sculpture there is a similar phenomenon whenever the subjects are supposed to have been connected with the time when the works were produced. Portrait statues and busts which perpetuate temporary modes among hairdressers and tailors, do not seem to bear letters of recommendation to posterity. Paradoxical as it may appear, it would not be far wrong to say that such works as the Elgin Marbles have a more modern air, or, in other words, are less separated from the present time, than many of the pictures and statues which

have been seen in Burlington House. An equestrian from Rotten Row would be more likely to recognise kinship in the cavaliers of the Panathenaic Procession than in the figure of the horseman which stands in Holborn Circus, although the latter is as true in its way as any dummy bearing a field-marshal's uniform in an army tailor's shop. To a student of the history of costume the figure of the PRINCE CONSORT will hereafter have its value, for the sculptor seems to have been inspired by the soul of a foreman cutter. Happily for art, students of that class are at all times likely to be in a minority. It is sure to share the fate of the statue of GEORGE III. in Cockspur Street, which is also a conscientious and estimable piece of work according to tailors and perruquiers' notions, yet might be removed to-morrow without exciting the regret of the crossing-sweeper. What could be more correct as a reproduction of the British cocked hat, frock coat, saddle, and field glass than the amazing figure which was lately removed to Aldershot? But, however excellent "the truth, the whole truth, and nothing but the truth" may be as a formula, it could not preserve even a part of the group for London. Probably few people would regret if the remaining statues of the Duke throughout England were sent to Hampshire to form a circle around it.

Do we not find a nearly similar state of things in literature? The books which reflect the life of an age become almost as quickly superseded as the corresponding pictures. The descriptions of London which DICKENS wrote in his first books have in less than half a century lost much of their effect. It has become almost a task to read those parts of the *Waverley Novels* in which SCOTT was truest to his own time. With all one's reverence for the Wizard of the North the law of skip has to be applied to him, and shrewd publishers recognising the inevitable give editions of his tales in which whole chapters are omitted. Who now reads the novels by GALT and others, which are said to be no less characteristic of Scottish life? A like fate has befallen literature of an earlier age. The plays which held the mirror up to nature in ELIZABETH'S days are known only to specialists. If SHAKESPEARE has met with a better fortune it is due not entirely to his surpassing genius, but to his generic descriptions. He is more than an Elizabethan subject. His scenes lie in "the brightest heaven of invention" rather than in Southwark or Stratford or the Queen's Court. Yet with all our reverence for the greatest name in literature, SHAKESPEARE is less influential than HOMER or VIRGIL as a factor in English education. A sort of protective system has to be instituted in order to gain a footing for a few of the plays in colleges and schools, and it is almost under compulsion that young people are made to study SHAKESPEARE as a classic.

We have left the consideration of architecture for the last place. If, however, we have referred to painting, sculpture, and literature, it is for the purpose of suggesting that they also come under an influence which, in a mysterious way, makes one form of a thing have a permanent interest, while other forms are only transient. Why, for example, should a copy in bronze of GEORGE III.'s pigtail become ridiculous in a few years, while the tangled locks of a Greek satyr in a relief that may have been carved three thousand years ago are not so? Why is the tuft of hair on RAUCH'S fine statue of the *Seated Victory* considered to be an excrescence which might be removed with advantage? The answer may be given in a few words. The modern sculptors copied arrangements of hair that happened to be in vogue at the time, while the patterns which were set up by the Greeks were probably independent of what was adopted. In costume it is the same. At the time when PHEIDIAS was superintending the works, the Athenian ladies may not have enveloped themselves in the voluminous drapery that is seen on the statues of the Fates from the Parthenon. The sculptor's office, as he recognised it, was not to produce a record of fashion in stone, and conclusions respecting costume should be drawn with more or less reserve from the figures. PHEIDIAS, we may be certain, gave more thought to the folds of the drapery than to the objections of the Athenian modistes.

Looking at the history of sculpture and literature it would appear that, in spite of all the efforts which were made for many hundreds of years, the works produced by the Greeks still continue in their supremacy. What is more important is that the statues which follow a Greek model have a better chance of overcoming the vicissitudes of time than those which have a more modern character. Almost analogous conclusions

could be drawn in respect of books, and with even less hesitation in respect of architecture.

What must strike the most superficial student of architectural history is that the influence of Greek examples has been exercised over a larger area of the civilised world and for a longer time than that of any others. There is no denying the majesty of Egyptian temples, but is there a chance of building half a dozen copies in the course of a century in any part of the world? The stuffs, metal-work, and carving of India are being more esteemed in Europe, still no one thinks of going into raptures over the buildings or of importing a gang of masons to erect a copy of an Indian house in the suburbs of London. Moorish work is very beautiful, but it is as much outside this world of ours as if it were Mexican or Chinese. What we see to-day has been long seen. All styles, with the exception of the Greek and its derivatives, have been local in application, found in districts that are outlying, far apart, and therefore isolated from that region wherein a progressive civilisation is the most marked characteristic.

Greek architecture has, when compared with other varieties, a claim to be considered as imperial, not only on account of the extent of the earth-surface in which some variety of it is seen, but also on account of its qualities. A Greek temple is supposed to correspond with the Greek character, and therefore may appear to be as local in its way as an Egyptian or other work. But the efforts which were made by the Greeks to improve the details of their architecture, what were they but attempts to remove everything which could be considered merely local or insular? A temple such as the Parthenon hardly looks like the work of an individual designer. There is nothing to denote any one man's peculiarities. In its way it is as purely intellectual as a book on geometry, and as much aloof from provincialism. Greek inventiveness must have been sorely tried by the restrictions which were put on novelties, and the little scope that was given to the imagination of the artists. Think of the labour that was necessary in setting out the subtle curves which are found in horizontal as well as vertical parts, and how the men must have felt that their refinements would be not appreciated by all eyes. The sculpture of the pediments, frieze, and metopes represented local traditions, and was a glorification of Athens, but the architecture belonged to the human race, and exemplified the reasoning no less than the æsthetic faculties of man. It was a search after perfection, and was one of the very few which obtained success.

The Parthenon being one of the products of that "dry-light" of the intellect which BACON desired, there is no reason why it should not be as universally adopted as the geometry of EUCLID. It can never become obsolete or old-fashioned, for the qualities which bring decay to a work have been eliminated from it. But from its perfection as a temple destined for a peculiar site it is limited in its application. A logical development of the Parthenon by Greek hands for secular purposes would have been a treasure. Among the Roman works which have been destroyed without any record of them surviving there may have been an attempt of the kind. We must, however, take Roman architecture as we find it, and recognise it as the successor of Greek work. Then after the lapse of centuries we find a resurrectionised Greek in ANDREA PALLADIO.

Italian architecture, of which he is the leading spirit, has inherited the position, if not the power, of the architecture of Greece. It is the style which in the nineteenth century has most claim to be regarded as universal. It is applied in all parts of the civilised world, and, somehow, never seems out of place. An English church, a colonial Parliament-house, a bank in a Chinese port, an American millionaire's palace, a railway-station, a public office, a theatre, can be equally well carried out in the style. So much cannot be said of any other style. Gothic, which for a long time has been its rival, has had to succumb to it.

The objection that can be raised against Italian as well as Greek architecture is that both are cold and inexpressive, and therefore ill-adapted to modern use. But are these qualities defects? A building is not always made to serve the use of one generation, and care should therefore be taken that expressive power does not in a little time become a bore. The symbolism that thirty years ago was supposed to be exhibited by a Gothic church, is it not occasionally a little wearisome? A dozen years hence will occupiers of houses dedicated to Queen ANNE be sincere worshippers of the lilies and sun-

flowers which may be included among the fixtures? If the present age has anything to express, it has no need of opportunities without turning architecture into an organ. A man can do as he likes with his own, and, if he despises a frozen architecture, such as Greek or Italian, it is easy to give him means to display his craving for notoriety. But there is an iron law which shows scant mercy to all freaks of fashion or of vanity. In literature, painting, and sculpture, nearly everything relating to them is only of transient interest, and apparently the same result is more constant in architecture.

## THE ARCHITECTURAL ASSOCIATION.

THE third ordinary meeting of the Association was held on Friday evening, the 21st inst., Mr. Cole A. Adams, president, in the chair.

### Amphitheatre at Senlis.

The PRESIDENT called attention to a letter received from the Secretary of the Restoration Committee of the Senlis Amphitheatre, stating that a lottery had been started for funds, and further adverting to the visit of the Association there in 1874, and the pleasure they had had in receiving the Association and showing them the amphitheatre. The President said that members who had joined in that excursion would no doubt, in view of the courtesy which had been extended to them in a foreign country, wish in the same spirit of courtesy and reciprocity of feeling to contribute something to the work. Any contributions sent to the hon. secretaries of the Association would be forwarded by them to Senlis, in the name of those who had taken part in the excursion.

Mr. G. AITCHISON, A.R.A., read a paper as follows:—

### On the Prospects of Architecture.

It is a pleasure to address you, for many reasons, and for these two in particular—because you are the natural heirs of the men of my era, and because nothing that is worth hearing will escape you.

You are in the enjoyment of youth and enthusiasm; some anxious to learn what can be taught, and to assimilate what should be assimilated; others burning to enrich London, their native town, their country, or even the world, with their works, which they hope will surpass the former achievements of man:—

If Nature put not forth her power  
About the opening of the flower,  
Who is it that could live an hour?

While we of more mature years, who have suffered the rubs of fortune, and most of whose illusions have passed away, are more anxious to give caution and encouragement to those who are to carry forward our torch in the race than for our own success.

It might, perhaps, be more agreeable to my hearers and myself were I to speak of colour—easier for me, and affording you the chance of feasting your eyes on fine old things when you are tired of listening. Yet it seems to me more important to point out to you the position of the art, the necessity of improving our practice of it, and, if possible, of showing the way. No improvement that I could suggest would compare in usefulness to the rousing your enthusiasm to that white heat in which the whole man is changed to that glorified state from which heroes and martyrs have been formed; for surely if our art is within measurable time to take the sublime forms that it assumed in ancient Greece, the new and mystic forms it took in Mediæval Europe, or the graceful and fantastic forms of the budding Renaissance, it can only be through the exultation of a few, whose fiery enthusiasm and abnegation of self will kindle the sacred fire in hearts now devoted to self-interest, self-advancement, self-glorification, and the meagre joys of five per cent.

You will have to turn your backs on the City of Destruction, to pass through the Slough of Despond, before you can enter in at the Straight Gate. And, unfortunately, there is no Evangelist to comfort you when you faint, nor to strengthen your resolves when you waver.

As I understand, there are certain conditions without which architecture, as an art, is impossible; there must be the laid-up wealth, much building on a large scale, and a taste—nay, a passion—for beauty, for sublimity, and magnificence, amongst the public; and there must be those conditions of law and custom that will not thwart the desires of the owner of the building. There must be the architects, honest, skilful, and inventive. I think we cannot doubt that the laid-up wealth exists, nor the need of buildings, some, at least, of large size, nor a sort of sluggish taste for work good of its kind; but I think we may safely say there is no overmastering passion in the public for architectural beauty or magnificence. There is, of course, discernment enough to know a good building from a bad one, but the inclination is rather to pick holes in the best building than to thank God that anything so beautiful could be made by man.

There are, however, laws and customs that, perhaps, do more than general apathy itself to check the development of the rising

taste for beauty; for instance, "leasehold tenure." Who will build magnificently for some one else? Is it credible that anyone will secure superb workmanship, the most enduring materials, and all the art that the best architect, sculptor, and painter can supply, if the building is to pass to a stranger at the end of sixty, eighty, or ninety-nine years? Besides, the freeholder will look to see that what his tenant wants to make his house perfectly fitted for himself is also fitted for after-tenants, even when he does not force upon his tenant some of his own views of propriety and beauty.

There is a fashion now for buying pictures, and an excellent fashion, too, so far as it goes, but I fear it is not altogether separable from the idea, that if the pictures are skilfully chosen they are better investments than any known on the Stock Exchange: else why are there so few friezes, wall pictures, and mosaics in buildings that are not leasehold? I merely mention this because it might otherwise seem that architecture had been outstripped in the race by the sister art. I am by no means sure that this is not the case; and if it be so, let us again draw up to the painters, and pass them if we can; no one objects to generous rivalry.

I ask, if painting be truly and honestly admired for its own sake, how it comes about that none of the pæans sung in its praise are sung in praise of our art? And why the architects who build more excellently than their fellows are not run after like the celebrated painters? On the whole we may say that the first half of the last one hundred years was a very artless one. We escaped from perhaps a worse fate than once threatened Greece, but no temples rose, and few monuments recorded our thankfulness and our victory. When we had modestly housed the Duke, put up a bronze Achilles to his glory, named Waterloo Place, Waterloo Bridge, Waterloo Road, and Waterloo Blue, our thankfulness and our enthusiasm expired.

If we compare the spirit of the Florentines in the thirteenth century, only just emerging from barbarism, and owning but one tiny city, determining that their new cathedral, St. Mary of the Blossoms, should exceed in magnificence any building that Greeks, Romans, or the proudest people of the earth had built, what a contrast they make with us, possessing an empire on which the sun never sets, but doubting whether we have enough courage, energy, and industry to keep what our fathers won for us, and when the supreme aim of the Government is to see if it cannot save three-halfpence off the architect's commission. So much for the public; now for ourselves. It would be as insulting as untrue to doubt the honesty of the generality of architects. I do not doubt that amongst the whole body of them there is much more skill than could have been found for a century or more, and it would be invidious to compare the individual excellence of living architects with the great who have passed away. We have reburnished the rusty armour and weapons of antiquity and the Middle Ages, are fairly skilful at the old fence; but I fear we lack the heart and the inventiveness of the old Paladins. No *coup de Jarnac* seems to be invented now. We bear too much resemblance to the men in armour at the Lord Mayor's show; the armour and weapons may be as good and as bright as armour or weapons ever were, the men may be bigger and their thews as strong; but their hearts have not the ancient courage, nor their souls the same devotion; and, even if the men were our modern Paladins, they would not fight in that armour nor with those weapons. Do not fancy that I suppose that any man can evolve a style; there must be something to start from, and a multitude striving in the same direction, every one of that multitude anxious to solve the pressing problems of the day, and several generations to bring the new thoughts to anything like completeness: but what we all feel is the absence of the first step. You know Viollet-le-Duc's comparison of the architects to an opera chorus singing "Let us go," though they all stand still.

It may be that the grand gift of architectural invention is only to be found in what we call new races; barbarous races that have suddenly emerged from their homes, who find themselves conquerors, and face to face with a higher civilisation, and in the possession of unheard-of wealth—such races as the Arabs and the Normans.

Amongst civilised nations, the Roman was the only one I know that slowly evolved a style. Unless one were a prophet, a necromancer, or whatever he be called, who can depict the probable development of past possibilities, it is impossible to say whether the Romans would have created a style of their own, could they have increased in wealth and civilisation without the subjugation of the known world. All we know is, they did not; they were born constructors, and had cultivated this native gift to great perfection even before they conquered Greece. The artistic excellence of Greek architecture dazzled their eyes and enslaved their minds. Like ourselves, they wanted excellence ready-made, and would not wait for its growth; but they were too practical a people to give up their advanced system of construction for the primitive one of Greece. They were not artistic enough to apply at once Greek principles of beauty to their own new forms of construction—the arch, the vault, and the dome. So apparently the art architect was created. He stuck vulgarised imitations of Greek work on to Roman construction, and it was not till five or

six centuries had elapsed that the Romans possessed a real style, one that ornamented their own native construction with appropriate forms. This style we now call the Byzantine.

The Greeks carried the old style of construction—the post and lintel—to the highest artistic perfection, and in a style differing from the Egyptian, Assyrian, or Indian; so a new system of construction is not necessary for a new style. The Romans having new constructive elements, gradually learned how to clothe them in forms of beauty that neither hid nor belied constructive truth.

The Arabs—for we call the conquered people by the name of their conquerors—somewhat improved on Roman construction, and certainly clothed their construction with forms that were wholly new and original. One of the most striking features of Arab architecture is the stalactite or honeycomb work, and, if Owen Jones's assertion is to be believed, this was gradually evolved from the attempt at copying series of superposed eggs and tongues that took their fancy. Here, to say the least, is the one step forward from which came such wonderful results. Before we have analysed the elements of it, an Arab honeycombed dome does not seem to be the work of man's hand, but to be the work of some superior being. Though I hope I may be wrong, I do not see this tendency towards development in modern architecture.

The Normans, with examples of Roman and Byzantine work at home, and with reminiscences of Syriac and Arab work abroad, gradually evolved a wholly new style. They, or some of the people they conquered and animated with their restless energy, developed the arch and vault to their uttermost perfection, and I think we may say they evolved and developed tracery.

If you think of the continuous invention implied in passing from columned and arched windows to the fantastic tracery of the Flamboyant, at first sight it seems that there was more invention then than now, perhaps because we can now see the transitions at a glance, though it really took four or five centuries to complete the development. Phases of plant growth, before overlooked or disregarded, took their fancy, and they piled the pyramid on the tower, and so gave what we suppose to be a novel aspect to buildings. At any rate, we know that the Christian cathedral is very different from the Pagan temple. Whether in the Babel of architecture that now exists we are slowly evolving a new style, no one who lives in it can say. We must not forget the almost frenzied energy with which the English architects of fifty years ago threw themselves into Gothic, how perfectly they mastered its apparent intricacy, till a Mediæval, revisiting the earth, might believe he had come back to his own time again. This training, with the Roman Classic forms ingrained in the people and re-revived, points to a new style partaking of both elements.

All I can do is to point out to you what little observations I have made. You have often heard me say that I believe that what taste there is, that is not antiquarian, lies in the direction of simplicity, and as I am sometimes charged with paradox—that is, saying that which though true is strange—I will now explain my reasons. The old sailing ship of my youth was of the uttermost complexity, with masts, yards, booms, and bowsprits, with shrouds, ropes, and dead-eyes, sails and pennons, a sculptured figure-head, and carved stern, while that modern monster of the deep—the ironclad—is as simple and black as a dolphin, with nothing but a funnel for its back fin. The old dinner-knife, curved like a scimitar, with its blobbed end to prevent stabbing and to eat peas with, its conical handle coloured green, and bossed with silver, has made way for the rectangular blade, in its oblong haft. The many-runged chair, ornamentally turned and fancifully carved, has been supplanted by one of four plain legs, with two rounded uprights, and a slightly curved top. I am not now speaking of art furniture. Every wheeled carriage that is turned out aims day by day at being more perfectly simple, and harness becomes less and less without a stitch or a rivet that is not for pure use. So much so that the old waggons we sometimes see, all chamfered curiously, the horses' harness covered with jingling brass plates, pierced and engraved, and with ornamental stitching, remind one of Mediæval days. And what can be of sterner simplicity than the new carriage of our time—the bicycle—which, when bestridden, presents us with the centaur of the nineteenth century? Take these observations for what they are worth: to me they point to simplicity of taste. We have two absolutely new materials, iron and cement concrete, and both these materials almost force us back to the pure post-and-lintel construction of the early days of our race. The use of iron should, at least, be marked in some way; but hitherto we have adopted the Roman plan. The girders with their vaults are covered up with a false ceiling in imitation of wood framework; and we cannot as yet be said to have turned ironwork to much æsthetic use. Of ornament we have no lack: does it point to anything in the heavens above, the earth beneath, or the waters under the earth, that the cultivated man of the nineteenth century cares for? We have our sacred animals, those devoted to sport—the fox, the roebuck, the red-deer, the pheasant, the partridge, the grouse, the woodcock, the trout, and the salmon. Do we ever see one of these put on a house because the owner is a hunter, a sportsman, or a fly-fisher? Do we see domestic pets—a cat, a dog, a canary, or a squirrel—carved on a house? Though there was one squirrel immortalised by figuring in the centre of each drawing-room frieze of a speculative builder's row of houses, this

squirrel would "have cracked his nuts in liberty" had not both been of plaster. Lions' heads we see by scores because the Egyptians, Greeks, and Romans liked them; nay, I have seen bullocks' heads on a bank, but I took that for the architect's monogram.

There are two emblems that the modern architect has taken under his especial protection, the stone cannon-ball and the flower-pot, and these are now receiving their apotheosis. The flower-pot I think I understand, but why the cannon-ball? Figure sculpture of this century we cannot have; our dress is too ignoble to be represented in any lasting material of one colour, and this is a terrible misfortune, for the bulk of mankind care for nothing but the present. The architect, like the poet, is born, and not made; though when either is born he takes a good deal of making; but in one respect the architect is more like the soldier than the poet, for after he has endured his training, and learned his drill, it is from the teaching of the actual strife that great generals and great architects are formed. Since the incubation of the Renaissance it is curious to note how few great architects there have been who have not measured some of the celebrated ruins of antiquity, at least of those who have succeeded in making fine monumental buildings.

The close communion with antique greatness seems in some measure to impart that greatness to those fitted to receive it. So, few great modern poets have not been Classical scholars; those grand exceptions—Shakespeare and Burns—were not unconscious of this misfortune, and repaired it by studying the antique masterpieces at second-hand.

Drawing is doubtless a great art. Not only does it enable us to show completely and brilliantly what we mean to do, but the training to eye and hand is invaluable, and we can mostly distinguish between the works of the architects who can draw and those who cannot; and if we cannot, the architect who is a brilliant draughtsman can, for he sees the improvised turns that the mere art of drawing suggests. Still this brilliant achievement is being carried in the present day beyond its legitimate end, or rather, I should say, it is made too much of, to the exclusion of more important things; though it helps us by forcing us to observe, and reveals to us some of the causes of excellence in buildings, though it enables us to have a useful gallery at hand for our study, commands immediate recognition, some flattery, and frequent success. It is scarcely studying architecture, and is too apt to draw us away from more tedious studies, such as measuring fine examples and calculating their proportions, studies more necessary for our education, and which are apt to call down on us the contempt of our friends and the gibes of painters, though the end of these studies is to increase our knowledge and to enable us to acquire that skill which is the peculiarity of the architect as distinct from the builder, the engineer, the draughtsman, or the designer. Paradox as it may seem, architectural invention is not the one distinguishing characteristic of the architect. His distinguishing characteristic is the knowing how buildings and their details will look at the height and distance at which they are to be seen; and this can only be learned by actual practice, if it be not learned by the measurement of existing buildings. Pheidias was a monumental sculptor, and in the competition for the pediment of the Parthenon his work was judged to be the worst; but he insisted that, as the sculpture was to be on a pediment, not on the ground, it must be seen at the proper height, and when this was done his was seen to be the best.

Mr. Ruskin, after one of his brilliant descriptions of an atmospheric effect on a distant hill, argues *à priori* on the probabilities of what the substance was which produced that effect, whether it was marble, ice, snow, or gold. He then walked up the hill, and found it to be caused by a wood of pine trees, and expatiates on the strangeness of the material chosen by Nature to produce such an effect. This is just our case. We have sketched something in a building which we consider successful, and are surprised when we try to produce a similar effect that our work is a failure. It is so because we have used the ice or gold instead of the pine wood. When you learn to draw freehand learn figure drawing, for not only does the padding out of the ghastly bones with the necessary flesh give lessons of how the purely necessary can be clothed with beauty, but the figure gives the best lessons in form, and the exquisite refinements that Nature resorts to, and it also teaches us the comparatively small difference between the curves that make beauty and those which make ugliness.

One form of wisdom, however, consists in proportioning our efforts to the task we have to do and the time and strength at our disposal, and it is not wise to make our plan so vast that we shall have neither time nor materials to rear the building.

The three great divisions of architecture are arrangement, construction, and beauty; each division is transcendental, and no man that ever lived could say he had perfectly mastered one of these subjects. Construction alone has of late years been raised into a profession, and no engineer could say that he had mastered it, and yet we have in that profession men of special and extraordinary ability, who have devoted their whole time to its study, who have won by it fame, titles, and fortune. And though M. C. Garnier's joke is not quite true that they are only architects who have not finished their education, yet to gain the name of archi-

tect we must combine in some degree all three. That this combination, with extraordinary excellence in each branch, has not been beyond the powers of some giants, who have added to it sculpture, painting, and poetry, is a reason why giants should not despair. All I say is, let us be sure we are good architects before we become painters, sculptors, and poets, and let us not lose the substance for the shadow. To aim at everything and to do nothing well is not, in my opinion, to win self-respect, not even fame.

Some of you may recollect Martial's epigram on Attalus, who did everything prettily:—

He that doth nothing well, all prettily,  
A very idle-busy-man must be.

No country, however, wants the aid of the real architectural sculptor so much as England. And if your taste leads you to abandon architecture, and become an accomplished architectural sculptor, every wise architect will hail you with delight. I may also mention incidentally that France has almost the monopoly of architectural illustration; the whole world is supplied by her, at least when the books are illustrated with fine steel engravings. Here at least is an opportunity for the highly-skilled architectural draughtsman, for France only has this monopoly by reason of her superior industry and skill.

We may say that geometry is the mother of architecture, yet how few study it. Read Professor Willis's paper on "Stonecutting in the Middle Ages," and see the great acquaintance there was then with it.\*

In the Arab writings, when a town or a palace is to be built, the king sends for the geometers and mathematicians, and those mysterious and intricate interlaced patterns, the real arabesques, are founded on pure geometry. Proportion is the soul of architecture, though every style gets some of its flavour from a tendency to some particular proportion.

The Reform Club is, I think, the most perfectly-proportioned building that has been built in Europe since the Italian Renaissance, and the story goes that Sir Charles Barry had the proportions of every celebrated Italian palace taken out, and took a mean for the club.

We know from Vitruvius that the Greeks had established a canon for proportioning their works, which the Roman architects imitated. We try to extract from old buildings the secret of their success, and we can in some cases obtain their proportions; but those proportions must be applied to some definite form, and it is just this definite form that we lack.

Like the fever-tossed patient, we try to get rest and ease by constant turning. We in this century have tried Greek, Egyptian, Italian; every period of English Mediæval from Norman to Tudor; Italian, French, and Flemish Gothic, Elizabethan, and the Dutch Renaissance; but no sooner have we mastered the style, and in some cases long before we have mastered it, than we abandon it for something else. This passion for change prevents us from exercising that power of modification on any style which might make it suit our wants and likings.

Our friendly but grumbling critic, Mr. Fergusson, has written high praise of us in his "Modern Architecture":—"As a body, the architects of this country have never been so numerous, so well instructed, nor so earnest in the exercise of their vocation as at present." Yet he is always insisting on his text that "modern architects do not think, they only copy," a saying seized on with pleasure by the ignorant multitude, but we know how far it is from being the case. I dare say that we think as much as architects ever thought, and copy less. I think that if you compare the buildings of one style that have been done in the last thirty years, and take thirty years either of genuine Gothic or Renaissance, you will see that the modifications of the latter are not much more than the former; although in the former case these buildings of one style have mainly been the production of a small band of architects only, while the latter were of the whole body. I shall show hereafter the absurdity of supposing that a new style perfected in every part, and precisely adapted to present use, can issue from the brain of any one architect like the armed Minerva from Jupiter's. Every architecture we know has gradually proceeded from the small modifications each age has made, and that, too, at times when more attention was paid to architecture than has been the case for the last century, when men's thoughts have been occupied with the discovery of the powers of nature and the invention of machines to utilise those powers. We must, at least, begin by modifying or paraphrasing some known style, or by applying the mouldings and parts of something we do not know to the rectangular brick box with holes in it.

If this paraphrasing of bygone styles were confined to England alone it would not so much matter, because then we should know it resulted from idleness or natural incapacity, but it extends to civilised man. France, Belgium, Switzerland, Italy, Germany, Austria, America, and Australia have nothing absolutely new to offer, so it is clear that neither race, climate, nor language can affect architecture; the defect must lie in the present civilisation.

I am inclined to believe, in spite of Dr. Johnson, that "poets

\* Transactions of R.I.B.A., vol. i. part 2. On the Construction of the Vaults of the Middle Ages, by R. Willis, M.A.

are but the tailors of other men's thoughts," and that which is true of poets is true of all artists. They are the men pre-eminently gifted with the spirit of their age, and blessed with the power of expression. If, then, the people of their time are heroic, you have heroic poetry; if the passions run riot you have passionate lyrics; if causticity and sarcasm prevail you have satire; but if the people have nothing poetical about them, the poet is driven to old themes. If the people are fat and shapeless they afford no scope for the sculptor; be they ever so beautifully made and in ever so fine a condition they will be useless to the sculptor if they wrap themselves in ugly garments that conceal their shape, and sculptors must revert to antiquity or die out. If the public care not for grace, dignity, or elegance in their habitations or public buildings, architecture dies, and dies more completely cut than any other art. Poets may sing, painters may paint, and sculptors model, but it is a rare case when an architect could afford to build even the Reform Club House for his sole use and delight.

If the public desires some sort of grace, dignity, or elegance, but does not much care what, and has no particular liking, as we have no style of our own, an old style is paraphrased till the public are tired of it, and then another style is paraphrased; in short, architecture, like the other fine arts, closely portrays the spirit of its age.

Some ancient nations called themselves "Autochthones," or sprung from the soil, and if the story of the Doric temple is true, that it was suggested by the native wooden hut of Greece, the Doric temple may be said to have sprung from the soil, and after centuries of gradual perfecting, culminated in the Parthenon. We know that the Romans with building—but as we suppose without architecture—tried to imitate that of the Greeks, and after five, six, or seven centuries created Byzantine; we know that the Normans copied as well as they could Roman and Byzantine buildings, and when touched by Arab art during the course of five or six centuries began and ended Gothic. The wave of Classic feeling that passed over Europe at first only wetted, as it were, the surface of things. The buildings remained Gothic, but with a savour of Classic; the mouldings, ornaments, and sculpture only were of Classic inspiration. Architecture then became as purely Roman as it could, and gradually losing all vitality, again made way for revived Greek and for revived Gothic. Many variations of Classic and Gothic have been introduced and practised, not to speak of flavours imported from Arabic, Moorish, Hindoo, Indo-Arabic, Chinese, and Japanese sources.

It is the easiest thing possible to imagine the throwing away of all former thoughts, traditions, and knowledge, the arrangement of buildings on purely rational principles with new and splendid effects, the whole clothed in new and beautiful proportions, adorned with new mouldings and ornament absolutely different from the past, and with figure-sculpture and painting animated by a new spirit, and that this combined perfection shall excite the admiration of the multitude and satisfy the fastidious taste of the cultivated. The only objection to this charming vision is that nothing of the sort has ever yet occurred in the history of our race. We should hear of African savages, who had heard nothing but the tom-tom, writing operas that surpassed those of Rossini or of Wagner; or North American Indians, who had seen nothing but a wigwam, erecting temples that surpassed the Parthenon or Notre Dame de Paris.

This visionary scheme was once put in practice. Brunel and Sir Digby Wyatt agreed to do the interior of the Great Western Railway Terminus on this principle. Brunel found the construction, Sir Digby the art; and every moulding was to be brand new, and no ornament was to be used as ornament, but only where necessity demanded it. You have the monument now before you of what one clever man can do.

It is admitted that without the "Iliad" we should not have had the "Æneid," nor the "Divina Commedia" without the latter; yet each had the flavour of its time.

The Gothic foliated cap is a Mediæval paraphrase of the Corinthian capital; the stellar vaulting is but the outcome of the Roman groin. We adapt our buildings to our present wants, and use the iron construction of to-day to meet our needs; and it is only when we seek to give our buildings the æsthetic flavour of the age that we fail, and I think the solution is that there is no æsthetic flavour in the age to give; the public are just affected with the slight flutterings of taste, and are beginning to think they ought to have something more slightly than the old brick box of their youth, with holes in it for doors and windows.

The twelfth century was the incubating period of Gothic; and it is quite possible that the nineteenth may be that of a new style; we have not only been gathering specimens of architecture, and architectural art from all parts of the world, but different architects, or groups of architects, have more or less assimilated the spirit of each. Let but the people of England, or of Europe, of America, or of Australia have some definite taste and desire, the creative genius arise, and all this apparent chaos may form itself into an organised shape, embodying the sum of all the art and charms that characterise each one, and proceeding to develop itself in as logical a way as Gothic did.

Maybe we have been making a bed of leaf mould—with leaves, too, from every part of the earth—from which the new tree may

spring. Although I am no prophet, it seems not so unlikely that this so-called Queen Anne style may be the germ from which the tree is to spring, adapting itself to the outline and freedom of Gothic with the Classic detail—and when I say Classic I mean excellent. Even now it does not refuse alliance with the best sculpture and painting that this age affords, as Gothic does.

The first thing wanted is for you to train and drill yourselves, and when the power of expression is attained, to observe the temper of the age, and to work out the style which will suit that temper, and seize on the budding aspirations of the age. My own notion is, that this will be found to be perfectly proportioned and graceful simplicity, almost free from ornament, but enriched with the finest sculpture and figure pictures that the age can afford. When you have done this you want to convert the nation, if the nation will then require any conversion. For if a national taste arise, you, as a part of the nation, must be imbued with its spirit, and be sure that, if you can give tongue to that aspiration, the pack will follow you. Probably there is no profession requiring so much study so poorly paid; so the architect works mainly for reputation and for fame.

Besides the hints about study that I have dropped in the course of this lecture, I want to direct your attention to the claims your art has on every age, in every nation. It is at least a lasting record of that age's taste and temper. From the durability of its works it to some extent supplies the want of those more brilliant and lasting records, eloquence and poetry. The illiterate nations of the past would be as last year's snow were it not for their architecture, and its enshrinement of the cognate arts. Let us suppose that the ancient Egyptians had contented themselves with houses, tombs, temples, and palaces of reeds and Nile mud, with all their glory and achievements, they would be as utterly gone from human remembrance as the men who built the lake dwellings. We know that Egypt must have been great, because we see how vast, sumptuous, and artistic are its structures, while its sculptures tell of achievements in war and peace. When we consider the power of our art to endue buildings with sublimity, grace, elegance, beauty, or even with appropriate gloom or horror—when we consider that our art is enshrined in buildings of vast size and of long endurance—when we consider, too, that they reflect the character of the age in which they are built—I cannot for a moment doubt that architecture is worth living for, although I must admit that we are at this moment beset with so many depressing influences that it is not surprising that some of us are tempted to despair—to throw aside our high aspirations, and to see if we cannot win in the race for fortune when we have lightened ourselves by throwing away the desire for fame. But I say, despair not; black and tempestuous as may be the sea on which you are about to venture, let your courage and endurance rise superior to the danger, and some of you at least will weather the storm. I believe that no good piece of work is ever thrown away, but even if you can do no more, you will help to hand down the tradition of your art unimpaired to happier times and more sunny days.

Master the art of architectural expression, master construction and arrangement, master a cultivated style, and then set yourselves to really adapt it to present requirements. Cut off all the redundancies, all that is not called for by actual needs, either practical or æsthetic; recollect, too, that iron must enter even more largely than at present into every building that is not of the most modest size. Consider that though the bones of the mammal are ghastly they are hidden, and that the bones of the crustaceans are outside. Nothing, for instance, can be more elegant in treatment than the shell of the king crab. Mountains, rivers, rocks, and forests, all abound in lessons for the architect. Every leaf and every plant may give him inspiration for a form, a moulding, or an ornament.

Reputation, honours, and fortune are the prime movers of the second-class spirits of the world; and if we do not wish mankind to relapse into sloth and barbarism, we should do what we can to uphold these incitements to exertion, and not let the envious, the dull, and the brutish abolish them, in the hope that when all are reduced to the condition of swine, they will be indistinguishable from the rest of the herd. Higher motives, however, have actuated the noblest of our race; men of brilliant genius and overwhelming power have devoted themselves to the good of the world, of their country, or their creed, for no greater meed than bare subsistence and a sense of duty. It is this spirit that I want you to adopt; perfect yourselves in your art, and then preach a crusade against the apathy and tastelessness of our age, and so confer on your country and your art a benefit of incalculable value. Did I not think this reward coupled with the feeling of having done one's duty was so much higher than any other, I might have pointed out the cases where pious monks, with no aims but the improvement of mankind, have ended their lives as popes.

The PRESIDENT said he was quite sorry when Mr. Aitchison came to the end of what he and all present had listened to as a most charming and delightful lecture. He was pleased to hear Mr. Aitchison's remarks and advice as to drawing in relation to architecture, and that he deprecated the practice of sketching a building or its details without learning how the effect shown in the finished building had been produced.

Mr. STANNUS proposed a vote of thanks to Mr. Aitchison, and said that they owed it to Mr. Aitchison more than to any other

person that iron, as a building material, was likely in the near future to have a fair trial given to it by architects.

Mr. HILTON NASH seconded the vote, and said the leasehold system seemed to be peculiar to the South of England, and that the further north you went, and in Scotland, houses were better and more solidly built. Knowing what Mr. Aitchison had done in respect of ironwork, he had hoped to hear something in regard to it.

The vote was carried by acclamation.

Mr. AITCHISON, in alluding to the hearty reception that had been given him, and the kind and complimentary words that had fallen from the speakers, said he did not think he could have been induced to give a lecture to anyone but the Association, and it was a great delight to think that anything he had said would produce a useful effect on architects coming after him, and who would he hoped be far more distinguished than himself. He had wished to arouse their enthusiasm. It would be an advantage if we had one style, though not a style so rigidly treated as to be called a cast-iron style, but something that, while it might vary in treatment, should at any rate express the general taste of the people of the country. If they would study, and if they would endeavour to give expression to their ideas, the problem might eventually be solved. If any act of ours could do it, it would only be by the younger men devoting themselves to the work with a singleness of purpose that would despise the things and motives that moved the ordinary run of mankind. And then, until they got the public to know what they wanted, and as long as clients did not care something for style, the prospects of architecture seemed to him to be bad. Those who had spoken had complimented him in regard to iron. That material was pressing itself forward, and would, there was no doubt, be more and more used till some other material still more suitable were found. One great difficulty was the liability to drip, and consequently girders were rather apt to be cased over to look like wood. Style, however, Mr. Aitchison said in conclusion, was not invented by one man, but must be the outcome of the tastes and feelings of a people, even though the movement might be led and controlled by some one master mind.

### THE INSTITUTE AND THE PROVINCIAL MEMBERS.\*

I HAVE before made allusion to the systematic and continuous neglect of the country members. To that part of the question I will return for the sake of dealing with one or two other points, beyond the grievance mentioned of the lack of representation on the Council. It cannot be alleged that the interests of the country members were neglected because their existence was accidentally forgotten. That lapse of memory only took place when changes were to be made or honours to be distributed, never when funds were wanted and increase of members were sought after. The records of the Institute repeat one continuous complaint of the lack of provincial members, of the way in which they held aloof from joining the Society. But the records are silent always as to any means being taken to make it worth their while to join, of any effort being made to place them on an equality with the London men. They are prolific in promises, barren in fulfilment of them. That the Institute should amongst its members count more than a third of provincial men is marvellous, considering the treatment that has been dealt out to them.

It is now seven years since the subscriptions of London and provincial members were equalised, an implied promise being inserted in the President's address that an attempt would be made to increase the influence of the provincial members, and to afford them additional advantages corresponding to the new taxation they were compelled to bear—a promise, it is needless to say, that was promptly forgotten when the financial juggling trick was successfully accomplished. Of flattering we have had enough. We demand a food more substantial than the windy utterances that for years have done duty for the attentions we have a right to call for. With a solitary exception or two, so rare as to need most careful research to discover, no country members have served on the many committees appointed at different times for various purposes. Take the later ones only. The Examination Committee, which settled on the scheme for compulsory examination of Associates, was composed wholly of London men. The Architectural Competition Committee of twenty-two members did not include one provincial name. At the present moment the provinces are unrepresented on the Professional Practices Committee, the Special Light and Air Committee, the Committee for Conservation of Ancient Monuments and Remains, the Finance Committee, and the Library Committee. The first of these—the Professional Practice Committee—is a dead letter without proper provincial representation. This body makes rules, and the Council proclaims the necessity of discipline amongst members of the Institute, and that all should comply with the regulations made. This is impossible when they are drawn up by one section only of the

profession—that, too, the smallest, regardless of the opinions and wishes of the majority. The demand, under present circumstances, is an intolerable one, and cannot but be scouted as unreasonable and absurd.

The Institute has too long been a mere clique of London architects—a private club of metropolitan Fellows, whose aim is peace and profit for themselves, and who would fain be left to the enjoyment of the preprandial chat round the Council board, and the agreeable dinner which follows, the enjoyment of which is so much enhanced by the feeling that they have previously satisfactorily disposed of the business of the head organisation of English architecture. The clique must be broken up, the Metropolitan Vestry Board of the profession dispersed, and a Council elected that will be representative of the nation, and not of a mere city, however important and cosmopolitan that city may be. An infusion of the robust common sense of the North, with even something of its rude outspokenness, that says plainly out the true definition of the vacillation and feebleness that has for fifty years characterised the work of the Institute, would be invaluable and must be brought about. Its policy of meddling and muddling is inevitable. It cannot be otherwise. It affects to speak for the country, and knows nothing of the practice and feelings of architects outside the cab radius of London. One monotonous recurrence of inadvised advance and inexcusable retreat makes the record of what it has mainly done for architects. The Council of compromise must make way for the Council of courage. Of promises and fair words we have had enough; of acts of justice and fair play none. The hands are the hands of Esau, but the voice is that of Jacob who stole his brother's birthright.

To conclude remarks already too long, it may be inquired, What do country members in particular demand? To a great extent an answer has already been given to such a question; but there is one thing in particular which carries within it the possibility of all the others. That is a vote by proxy. Without that, all idea of justice to provincial men, of giving them any share in the control of things, is mere nonsense. No influence can be wielded by country members without it. The existing need of the presence of those who vote simply deters any but Londoners from ever troubling their heads about the affairs of the Institute. The vote, through which alone they can make their influence felt, is too expensive a luxury for any but men of abundant wealth. Let me give an example—my own. Last year I was anxious to exercise my right of franchise in the question of a diploma. Twice I specially journeyed to town for that purpose, and each time, without notice, the matter was adjourned. Assume, which I have no grounds for doing, that the ballot is taken the next time the question is raised, and that I am foolish enough to try once more to be present as a voting Fellow of the Institute. Let us see what that vote will have cost. Three railway journeys to town, at 2*l.* 10*s.* = 7*l.* 10*s.* Three days' hotel expenses at, say, 15*s.* = 2*l.* 5*s.* Three days' time, at 5*l.* 5*s.* = 15*l.* 15*s.* Altogether, the sum of 25*l.* 10*s.* as the cost of exercising the franchise by a country member at the Institute. There is no need to enlarge upon the bare statement of fact, and no need to ask why provincial members take so little interest in an organisation in which they cannot reasonably make their influence felt.

The position taken up by the Council has always been that to grant this demand for voting by proxy would be to run counter to the plain directions of the charter. I venture to say that it would not. And I venture to say, too, that the charter has never yet stood in the way of the Council when they wished to break through its clauses. They could stretch their consciences sufficiently to do this when they desired to establish a new class of members under the name of Honorary Associates, in direct defiance of the words, "And our will and pleasure is and we further grant and declare that the Institute of British Architects shall consist of three classes of members, to be respectively called, 'Fellows,' 'Associates,' and 'Honorary Fellows.'" They wanted the guineas of a new class, and no charter was allowed to stand in their way to prevent them getting these. The Council in 1877 got, by fair promises, the guineas of the provincial men; but they have no wish to give them their right to vote, lest they should be speedily called on to dance to a tune that would not be of their own selection. In 1858, the then President, Earl de Grey, along with other members, offered to the Institute shares in the Architectural Union Company. To hold these was distinctly illegal; yet the Council had no difficulty again in over-reaching the law for the sake of gain, the secretaries being put up as the nominal holders, and to represent the Institute. On another occasion the Council desired to alter the mode of election of Fellows so as to require a majority of four-fifths of the votes given to entitle to success—a proposal so clearly contrary to the letter and the spirit of the charter that the consulting solicitor at first plainly ruled it to be inadmissible. A second attempt to persuade their solicitor to more obliging manners was victorious, and he decided that the mention of a bare majority in the clause of the charter was only intended to apply to *general* meetings and to Council meetings. Ordinary or sessional meetings, on the other hand, not being mentioned in the charter, were not, therefore, considered subject to the clause.

The Council profess to feel acutely the difficulty which prevents

\* From an address by Mr. J. W. Connors, F.R.I.B.A., read at a meeting of the Leeds and Yorkshire Architectural Society on the 17th inst.

their granting to country members the right of voting by proxy. Here is a clear way out of the block. General meetings called for the election of officers are subject to the regulations of the charter; ordinary meetings, by the decision of the Institute's solicitor, by the acquiescence of the Council, are not. Let all matters of importance be decided by ordinary meetings, which are not controlled by the charter. Let general meetings for the election of officers, which are, be preceded by an ordinary meeting, at which votes by proxy will be received, and which will decide in that way what names are to be submitted for formal acceptance by the following general meeting. This plan is simple, is perfectly legal (or else the Council have been acting illegally for years back), and permits of the exercise of voting by proxy, which is the chief demand now made by country members. The proposal is so convenient that it is astonishing the Council should never yet have seen so easy a plan for granting a boon which they claim to have been anxious to give to provincial members. If an ordinary meeting has the right to act contrary to the charter—and the Council say it has—there is no reason whatever why an ordinary meeting should not decide what names of officers should be submitted to the general meeting, and the general meeting certainly cannot elect officers against the voice of the ordinary one if only a sufficient number of names to fill vacancies are submitted to it. All other questions of importance outside that of electing officers need never come before any other than ordinary meetings, and, as voting by proxy is admissible at these, they not being under the charter, the whole question rests with the Council. If they still find a way by which to avoid giving this just right to country members, it is because they seek not to grant it, but to discover some plausible excuse for not doing so.

My indictment of the Council is by no means complete, and has omitted mention of innumerable sins of omission and commission. If the list of these is not exhausted, your patience must be; and I have, I think, said enough to sustain my position. It will be urged that I heap up blame too deeply on the Council, and that no amount of zeal or skill could have achieved all that I appear to demand from them. That it is too much to expect that all the reforms in the profession which I have incidentally mentioned should be brought about, I at once freely admit. But so long as none of them have been seriously attempted, I am justified in blaming them for the want of any. The policy of the Institute, from the day of its foundation to the present time, has been that of shelving all inconvenient questions, of adjourning all serious work, of shirking every great difficulty. Beyond all other matters it is deserving of the reprobation of all true architects for the deliberate way in which it has ever permitted itself to remain weak and unimportant when it might have been strong and powerful; to be despised and neglected when it might have been venerated and courted; by passively allowing itself to be a vestry when it might have been a Parliament; to remain a private club when it might have been a national institution. This is the head and front of its offending, the source of its weakness, the cause of its comparative failure. Whilst our venerable leaders are engaged with feeble playfulness in debating worthless questions, and with nimble alacrity are adjourning with prompt delight all matters of real importance, the tide of popular contempt is rising with unchecked and pitiless regularity. When the forefront of battle has no firmer rank than an array of ancient dotards, and bearing, with palsied hands, forgotten weapons, meeting the mitrailleuse of their opponents with the cross-bow of their forefathers, and forbidding their eager followers to make use of modern arms because these have not the dignity of long descent, the value of archaeological interest; when in impotent attempt to maintain a brave show of dignity, on fear-stricken limbs, they make a brave show of defiance but to conceal the feebleness of their position, and to maintain the poor dignity of unmerited leadership, can we wonder that they try to attain their objects by unlimited surrender? The right to an extended knowledge of scientific construction, to the execution of the greatest of modern constructional achievements is surrendered to the engineer. The right to an intimate acquaintance with the framework and essence of building is surrendered to the quantity surveyor. The right to the execution of the national works of the age, the monuments of the nineteenth century, is surrendered to the Board of Works. The very right to criticise a modern street is surrendered, as the last feeble gift of powerless incapacity, to a metropolitan vestry. What is left yet to abandon to the acute enemy who waits without the camp for what poor remnant our purblind Council would yet retain? It is but little. The modern architect is but a designer of wall-papers and country houses. The works which command the admiration of the passing wayfarer have been the creation of others who have had less claim by far than ourselves to their execution, but who have, by dint of sheer effrontery on their part, and imbecile weakness on ours, carried off prizes within our own reach and right. They do it, too, with an open scorn and contempt which the attitude of our leaders has justified them in assuming. It is but months ago that the Israelites of quantity surveyors marched around the Jericho of the Institute blowing for three days their own trumpets, and, though their only weapons were wind instruments, and they encompassed the city round about with their own ineffable self-sufficiency, lo! as they shouted with a great shout when the priests

blew the trumpets, the walls straightway fell down and every man entered in and took the city, and the fame of the quantity surveyors was noised throughout all the country. It was but an episode in the later history of our Central Society—the last sop given in futile hopes that the foes themselves might support the weak hands and maintain the feeble knees of those who are bravely obstinate when diplomacy might serve their turn, and panic-stricken cowards when courage would win the day.

It may be assumed that I have no right to blame the Institute for the position of architecture to-day. I cannot concede the point. The Council stand as the recognised exponents of our professional position to the public. As such they must accept the blame if the profession loses ground before the outside world, even as they would arrogate to themselves the praise if the reverse had been the result of recent years. Scant respect must be the inevitable result of the contemptible exhibition of feeble vacillation which the transactions of the Institute disclose. The burning question of competitions with its intricate difficulties, and its corresponding importance, is handed over to be dealt with by a committee outside the Institute, the Council only interfering to insert a mischievous and uncalled-for clause, and so its plain duty is cheaply shelved. The duty of maintaining some show of student education from year to year met with recurring neglect, till a new organisation took up the work so shamefully forgotten, and by its vigour and energy struck a success that might have been the Institute's years before, and showed that the profession had within it a life and earnestness wanting only leadership to be animated into concrete activity. The universal demand that our profession should be brought up to the level of others, by the institution of some qualification marking the capability of each member of the Institute, was met by a ridiculous half measure, which closed the doors of the inferior grade of membership, and threw wide open those of the superior to every charlatan who assessed the value of the title of Fellow at four guineas per annum. When contemptuous indignation covered with confusion the absurd attempt to set up a diploma foredoomed to ridicule by the very action of its promoters, the Council scared themselves like children with a legal bogey, built up by their own ingenuity out of an ambiguous phrase in a worthless charter, and shook their ghost of conveyances, parchment inflated with their own fears, as a justification of their failure to fulfil an admitted responsibility.

Vacillation and procrastination: these are the special characteristics of the Council. Questions of the gravest importance have been before them for years, till every conceivable resource of prevarication has become exhausted in the endeavour to adjourn without rejecting them. Such is not the conduct likely to forward the interests of an important profession, and to maintain the dignity of the Institute before architects or in the presence of the public.

Where lies the remedy? Certainly not in inaction or toleration. Whatever its faults and failings, the Institute is and must be the centre of English architecture. To weaken it by secession or abstention is to damage the general interests of the profession. The only course, it seems to me, is to join it in numbers sufficient to make the provincial element strong in proportion to its numbers; thus to make it truly national and representative. Then agitate for the right of voting by proxy until the right is forced from the unwilling Council, and then to "Shape our ends, rough hew them as they may."

#### BUILDING BY-LAWS IN MANCHESTER.

A PAPER on "The Building By-Laws" was read by Mr. J. Holden, President of the Manchester Society of Architects, at the last monthly meeting of the North-Western Association of Medical Officers of Health. Mr. Holden said that the condition of numbers of the dwellings of the poor had of late years been considerably improved, although in some parts of Manchester they were bad enough yet. The authorities, both there and elsewhere, had taken up the matter, much money had been spent, and, in places, whole districts had been swept away and remodelled. Generally speaking, the authorities deserved great credit for what they had done, but much yet remained to be accomplished, and they required to be kept up to their work. Before, however, the authorities could act, they should have power to act which should be unmistakable and within the knowledge of all. In Manchester, for instance, the by-laws did not represent anything like the authority of the Corporation. The by-laws of the different local boards and sanitary authorities were in quite as unsatisfactory a condition, and further inconvenience arose from the fact that each authority compiled its own regulations seemingly without reference to any others. Mr. Holden pointed out various anomalies which obtained under this system as to width of streets, thickness of walls, dimensions of timbers for joists, yard space at back of buildings, height of rooms, drains, &c. In addition to all the matters in house construction over which the authorities had supervision, Mr. Holden urged that the character of the materials, and also the workmanship, should, in some cases, be subject to control, but that it should be open and above board and clearly defined. Looking at the character of a vast quantity

of the property which was springing up, he would rather increase than control the powers of the authorities in the right direction. The by-laws in Manchester were particularly meagre in detail, and a great deal of the information required, in fact most of it, had to be obtained verbally by application to the different surveyors. It would appear to be the desire of the Corporation not to make public the powers with which it was invested, at least that was the view to which he, and, he believed, the members of his Society, had come. The sooner the by-laws of local boards were amended and made more in accordance with the model code issued by the Local Government Board the better, above all things letting it be borne in mind that they should be made as full as possible, so that the public might know what was required of them, and leaving as little as possible to the discretion of surveyors or inspectors, who were not always specially educated. Generally it appeared to him that there was a disinclination on the part of the different authorities to apply for advice or suggestions to those who, from their knowledge of the questions involved, could give it to them, and the different societies whose suggestions might be expected to be of use seemed to be systematically ignored. Speaking for the Manchester Society of Architects, it was, he was sure, their desire to render every possible assistance in such matters. A discussion followed, in which the importance was insisted upon of supervision in the matter of quality of materials used, every regulation at present pointing to dimension only.

### THE RESTORATION OF WESTMINSTER HALL.

THE Select Committee appointed by the House of Commons to consider the question of the restoration of the west front of Westminster Hall met again on Tuesday, Mr. G. Shaw-Lefevre (late First Commissioner of Works) presiding. The other members of the Committee present were:—Mr. Beresford-Hope, Mr. Dick Peddie, Mr. Walter, Mr. Cheetham, Sir H. Holland, Sir E. Reed, Mr. W. H. Smith, and Sir J. Lubbock.

Mr. Charles Barry, architect, was called to explain his father's views with regard to the completion of the scheme of the Houses of Parliament. The restoration of the west front of Westminster Hall had been under consideration for a long period, and witness was surprised that his father's proposal for the construction of buildings on that spot had not been taken into account. He now came forward to explain that proposal. He had not done so earlier for the reason that while the Office of Works confined itself to only one plan, he had considered it unprofessional to attempt to interfere with the discretion of the First Commissioner. It was only when the House of Commons, with the concurrence of the First Commissioner, agreed to consider the matter more broadly that he had thought it his duty to his father's memory to ask to be allowed to submit the original proposal to Parliament, and to leave with Parliament the responsibility of omitting to carry it out or the reverse. Witness had been for some years engaged in architectural work with his father—from 1841 to 1847—and subsequently on his own account. During the years he was with his father the Parliament buildings took their permanent shape, and he was thoroughly conversant with his father's views with regard to the completion of the structure. They were to start with a façade from St. Stephen's Porch, following a line from St. Margaret's Lane to the corner where Bridge Street, Great George Street, and Parliament Street intersected each other, to construct at that corner a great gateway, and carry another new façade from that point to the clock tower. The idea had been to give the whole building as much dignity and unity as possible, to conceal the difference of level between Bridge Street and the entrance to Westminster Hall, and in possible times of tumult to give an effective protection to Palace Yard, Westminster Hall, the Speaker's House, and the House of Commons. Sir Charles Barry had attached great importance to having Palace Yard enclosed; he was thoroughly acquainted with the history of Westminster Hall with respect to its exterior, being decidedly of opinion that it was never intended that it should be seen; and he had always been of opinion that the space then occupied by the law courts had been devoted in earlier times to the inferior offices of the old palace.

Mr. Shaw-Lefevre asked whether Sir Charles Barry had left behind him any documentary evidence of his opinion upon the former appearance of the west front.

Mr. Barry replied that probably he had, but no search had been made for it, and the present evidence was, therefore, founded upon a personal recollection of the architect's views.

Mr. Shaw-Lefevre said that, substantially, Sir Charles Barry's plan was to erect a new wing or frontage to the Houses of Parliament, joining Westminster Hall at St. Stephen's Porch, running to the corner of Parliament Street, and from there joining the clock tower.

Mr. Barry acquiesced, adding that his father had left the lower face of the clock tower unfinished in brick, and that the brickwork had not been covered with stone until Mr. Ayrton's period of office as First Commissioner of Works. No doubt the carrying out of Sir Charles Barry's plan would affect the roadway between the site of the old law courts and St. Margaret's Church, but the plan could be easily modified to prevent any incon-

venience. The court would be reduced in size, but it would still be large enough. If a cloister were erected at the west front of Westminster Hall, it should only be of one storey. He did not agree with Mr. Pearson that it was proper to leave Westminster Hall exposed as a foil to the Houses of Parliament; on the contrary, he believed that so leaving it was injurious to the dignity of the whole building. The proposed building at right angles with Westminster Hall would be quite inconsistent with any realisation of his father's plan. The latter contemplated the hiding of Westminster Hall from outside view; it would be absorbed in the building. He did not think his father raised the floor of the hall, and, therefore, altered the internal proportions. He was sure there was no elaborate scheme for the raising of the floor or roof of the hall. His father altered the west front of Westminster Hall, and he would not have hesitated in altering the east front if he thought he could have improved it.

By Mr. Walter: He did not think that the level of the floor had been altered within the memory of man. Although Westminster Hall was the finest structure of the kind in the world, it was still low in proportion to its width and length; he should have liked, as a matter of taste, to see it 10 feet higher. He was not aware that the weight of the roof had ever been estimated. If at any time it was decided to raise the roof, the operation would, in all probability, be completed by means of levers and screwjacks.

Replying to Mr. Dick Peddie, Mr. Barry said that if his father's plan were carried out it would be found to provide quite as good, indeed better, accommodation than Mr. Pearson's plan provided. Witness had studied all the old plans which existed, and he shared his father's opinion that Westminster Hall was not intended to be seen from the exterior. He certainly should not think of proposing, as was suggested by Mr. Pearson's plan, that there should be a grand committee room, or a meeting room of any kind, above a standing-place for horses and other conveniences.

Mr. Beresford-Hope: Supposing Mr. Pearson's plan were rejected, have you a plan you could propose for us more or less similar in principle to your father's plan, but nearer in cheapness to Mr. Pearson's?

Mr. Charles Barry: If I had been officially asked, I should have been pleased to have prepared one. I, however, think my father's plan would be cheaper in the end. It is certainly better to spend half a million upon a building which would be thoroughly useful than to spend 25,000*l.* upon a structure that would be useless.

By Mr. Shaw-Lefevre: Mr. Pearson gave very good reasons for supposing there was originally a double-storeyed cloister on the western front of the hall. Witness, however, considered that modern requirements were of more importance than the reproduction of the old state of things. Failing the adoption of his father's plan, he should suggest that there should be, if anything, a one-storeyed cloister under the buttresses.

Mr. Somers Clarke, architect, said, in reply to Mr. Dick Peddie, that he had for a long time taken a deep interest in archaeological matters, and last year had read a paper before the Society of Antiquaries on the subject of the west front of Westminster Hall. He had examined the site and the hall as it at present stood, and, though he agreed with Mr. Pearson as to the dates of the archaeological remains, he could not support that gentleman's view as to the character of the ancient building which had occupied the site. Mr. Pearson's restoration could not be based on authority, and any architect undertaking the work of restoration must be almost entirely guided by his imagination. Mr. Pearson in his plan gave a wall where undoubtedly a wall had anciently existed, and a parapet where there had been a parapet before, but beyond this, and for the details of his proposal, he had no authority. The building proposed to be erected at right angles with Westminster Hall was confessedly unauthorised.

Mr. Shaw-Lefevre remarked that Mr. Pearson had never proposed to give an exact restoration of the ancient building.

Mr. Somers Clarke said his own impression was, judging from the earliest illustrations they had, that originally there had been a wall running round the western side of the hall, and that inside that wall there were a number of buildings which shut out all the west front of the hall, save the roof, from view.

By Mr. Shaw-Lefevre: He would himself propose that the old Norman wall of the hall should be preserved by a covering which would as little as possible falsify the character of the old building. The marks of the Norman masons and the old stonework were of great historical interest, and should by all means be preserved, and the covering he would propose would be a long timber gallery—such as was to be seen in Cheshire—under the flying buttresses, and 8 or 9 feet from the hall. Sir C. Barry's designs for the completion of the Parliament buildings should then be carried out. He did not believe it had ever been intended that the west front of Westminster Hall should be seen. If Sir C. Barry's design were not carried out, the gallery, witness suggested, should be constructed, and should be shut out by a row of trees.

In reply to Mr. Walter, witness stated that "restoration" was a vague term, and so-called restorations were sometimes carried out in a conventional, and not in the strictest sense—carried out to the destruction of the architectural value of the buildings.

The Committee again adjourned.

## YORK ARCHITECTURAL ASSOCIATION.

ON the 20th inst. a lecture was given in the saloon of the Victoria Hall, Goodramgate, by Mr. G. W. Milburn, vice-president of the York Arts Guild, and there was a good attendance. The president (Mr. A. Pollard) occupied the chair. Mr. B. Priestley Shires, the hon. secretary, drew attention to the question of an architectural diploma in architecture being granted to all *bond-fide* architects, and trusted the society would discuss the matter thoroughly at an early date and forward the Royal Institute of British Architects a memorial to that effect, as there were in that distinguished body Honorary Associates, members of the Legislature, and for that reason, as well as others, it would be more easily worked through them, and concluded by saying that he felt sure this great question would be settled to the satisfaction of all true architects. Mr. Milburn, in the course of a very able lecture, and by means of many rapid sketches on the black-board, fully elucidated the study of the ornamentation of the Early English period of architecture, pointing out, by the way, the numerous ways the trefoil, the quatrefoil, and the cinquefoil leaf was adapted to every prominent feature of the building, and concluded by laying great importance to the junior members of the Association of modelling. The President, in thanking Mr. Milburn for his lecture, trusted that they would have the presence at no distant period of Mr. Milburn to continue the subject through the subsequent styles. Mr. Benson seconded the vote of thanks, and Mr. Norman R. Yeomans and Mr. J. Perry supported the vote, which was carried. Mr. Milburn, in responding, said it would give him great pleasure to accede to the request of the President. It was announced that the annual grand conversation would take place in the water-colour galleries of the Yorkshire Fine Art Institution on Friday evening, December 5. Mr. W. D. Grave was duly elected a member of the Association.

## GLASGOW ARCHÆOLOGICAL SOCIETY.

A PAPER on "Some Archaic Types of Society in Scotland" was read by Mr. G. L. Gomme, at the twenty-eighth annual meeting of the Glasgow Archæological Society. The author said that if he were asked to name a nation of the Western world which had retained more archaic life to within the time of scientific observation he might perhaps fix upon Russia, with her vast unbroken clan communities, with her still uncommercialised villages and villagers, taking first rank, but he should certainly mention Scotland in almost the same breadth. In Highland and Lowland Scotland had existed a state of society which had not broken up at the dawn of the present century, and which still retained in isolation what was once generally prevalent. The chief characteristics of archaic societies were—(1) relationship of all the members, either actually or in theory—*i.e.*, the clan or tribe; (2) the gradual displacement of kinship, as the basis of cohesion, by land—*i.e.*, the village; (3) the ownership of the land and all except personal goods by the community, and not by the individual; (4) the periodical, generally yearly, division of the arable land by lot to every owner of a tenement; (5) the common right of pasture; (6) the general community of interests conveyed by the legal axiom, "Joint in food, worship, and estate." After referring to the peculiarities of the burghal community of Lauder, in Berwickshire, the speaker said that an exactly similar case was to be found in the village of Kilmaurs, in Ayrshire, which was erected into a burgh or barony by James VI. The land of the barony was divided into five-pound lands of 240 acres, such lands being disposed to forty different persons in feu farms and free burghage, and to be held in equal proportions by their heirs and successors. The mode of holding this was by "runrig," and there was in the course of time a possibility of this becoming one property. Every man who was elected a magistrate must be a portioner, as must also the electors, and no woman could succeed to an inheritance in such burghs or marry without a special license. This was the archaic type of village life, where the right of succession was based upon kinship, and where, if the right of succession failed, the land reverted to the community. After alluding in detail to some peculiarities about Newton-on-Ayr, Mr. Gomme directed attention to archaic types in the Highlands, instancing particularly the types to be met with in the island of Harris in 1795. Summing up his instances, he said he thought there was evidence enough of two distinct types of archaic society in Scotland—the village community in Lowland Scotland, with village rights, village law, village assembly, and all the incipient institutions which might develop into burghal towns of commercial importance; and, secondly, the tribal community, joint tenancy as they had become now, of one landlord, clustered into houses which made a farmstead, and possessing in the so-called cottar-towns dependent servants, whose labour belonged to the farmstead. In order to show that the tribal community was far more ancient than the village community, he directed attention to the dependent cottar-towns of the Highland tribes, and he pointed out that village life was only possible when trade had already taken an initial

step. He also pointed out that the Skye crofter, in dividing his land into patches and shreds to afford a separate dwelling for each son and daughter who married, was only obeying the old tribal custom of gavel. Traces of this and its differentiations were numerous, and were extremely important for the right understanding the inner life of tribal and clan society. To these subjects he would direct the attention of archæologists; and he believed Scotland must be full of clan folk-lore, which would be well worth following up.

## CHURCH PLANNING.

A LECTURE was delivered to the members of the Glasgow Architectural Association, on Tuesday, by Mr. John Honeyman, F.R.I.B.A., on church planning. Mr. Honeyman said it might perhaps be thought that, as there was a very large number of different sects, there must necessarily be a great many different types of church plan, but this was not so, as the peculiarities of the sects came out for the most part in their furniture, occasionally in their millinery. Even the proverbial "barn" of the strictest sect of the Presbyterians might, by the introduction of the appropriate upholstery, and the mystic words of consecration, be transformed into a temple where the "highest" of the Ritualistic priests would not disdain to worship, and, in point of fact, many of the older churches in London and elsewhere were not so well adapted for the Episcopal Ritual—for which they were designed—as the new Presbyterian church in Pont Street, lately designed by Mr. Macvicar Anderson, or such churches as Blythswood, Camphill, Woodlands, Hillhead, and others in Glasgow which might be named. He defined a church as a building designed for use as a place of worship by any denomination of Christians. He remembered the time when all such buildings—except those belonging to the Established Church—were called chapels, but now we had not merely Free Churches and U.P. Churches, and even Unitarian Churches, but Roman Catholic and Episcopal Cathedrals—which, he ventured to think, was just a little too much of a good thing. At all events, under existing relations between the Church and State, there seemed a palpable impropriety in the public recognition of such assumptions, and the dignifying of Dissenting chapels by a title which some would withhold from the venerable High Kirk. All churches had some characteristic in common of much more importance than their accidental peculiarities; and he purposed confining their attention to these under two heads—First, convenience; second, comfort. He would not add beauty, because he maintained that so far as that depended on the planning it must be made subordinate to the other two. It would be a shame not to make a church beautiful, but the primary requisite was shelter, with convenience and comfort. Having ascertained what was best, they should clothe it with beauty, and remember that they were not civil engineers, but architects. Under the first division of this subject, Mr. Honeyman spoke of form, access, arrangements and accessories. He said that a cruciform plan was bad acoustically, and the shorter the transept the worse was the effect. A church with side aisles was objectionable, unless the aisles were used merely as passages. Referring to access and egress, he said that a great many other things had to be considered besides the mere width of the doors. In a large church a great deal would depend on their position, the size and form of the porches or lobbies, the width of the passages and stairs, the way the doors were hung and fastened, and the arrangement of doorsteps and stairs. For example, while it was convenient to have only one door of ingress, it was insufficient and inconvenient to have doors of egress only at one end, even if of ample width; and he need hardly say that it was equally inconvenient when there were doors at both ends to keep those at one of the ends always locked—not at all an unusual thing. Referring to the introduction of organs, he objected to an organ being set up at the end of a church, as if it were the idol of the place. At the same time height above an organ was indispensable, and a side aisle was as a rule too low. When speaking of accessories, he recommended that there should be two roomy cloak-rooms, with attendants to take hats and cloaks; and also that the heating apparatus should be kept constantly in operation throughout the winter, as the surest method of preventing disagreeable draughts. Upon the whole, he thought the most comfortable form of auditorium was something in the form of a modern theatre. There was nothing shocking in that idea, except to inveterate prejudice, from which they were bound to shake themselves clear if they would not abdicate their proper position as moulders of public opinion in matters of this kind. With a thoroughly good, beautiful, and perfectly comfortable auditorium, everything else was simple, and stage accommodation, with furniture and properties of every kind, could be easily made to suit the requirements of any sect. Mr. Honeyman recommended his audience to look at the subject from an enlightened, unprejudiced standpoint—to think for themselves.

At the conclusion of the lecture, after some remarks by the chairman and members, a vote of thanks was awarded to Mr. Honeyman.

## ILLUSTRATIONS.

DESIGN FOR A MOOR-SIDE CHURCH.

THE arrangement of this church is uncommon, being designed to meet the difficulties of a very steep site, and the requirements of a building of combined and varied purposes. The plan comprises a nave (40 feet by 18 feet) with north aisle (40 feet by 10 feet), these being seated for the accommodation of a congregation of about 200 persons; north and south transepts, the former utilised as an organ-chamber, with vestries at the rear, and the latter being devoted to the uses of a founder's chapel. The central tower would rise over the chancel, this terminating in an apse. The south porch, baptistery, and the memorial chapel at the south-west corner of the edifice, take the place of the usual south aisle. A recumbent memorial would be placed in the centre of the chapel. A crypt would be formed beneath this chapel and across the western end of nave and north aisle, from which the church would also be approached by a staircase, for the convenience of those coming from the valley below.

The architect is Mr. HERBERT W. BOOTH, 23 George Street, Halifax, from whose drawing, recently exhibited at the Royal Academy, our illustration is, by permission, reproduced.

NEW SCHOOLS FOR THE WOOLTON WAWEN SCHOOL BOARD.

THESE schools have been recently built at Henley-in-Arden, from plans by Mr. HAWLEY LLOYD, of 79 Colmore Row, Birmingham. The site upon which they stand is an unusually suitable one, having a frontage to the main street, and being bounded on either side by private roads, which allow of separate entrances to the playgrounds as well as the school buildings for both the boys and the girls and infants.

Mr. F. J. BRILEY, of the Coventry Road, Birmingham, was the contractor. The cost of the buildings, together with the walling and draining of the playgrounds, amounted to 2,023*l.* 10*s.* 9*d.*, or 7*l.* 3*s.* per school-place provided.

The walls are internally of Stratford-upon-Avon machine-made bricks, and externally are faced with local hand-made red bricks. The roofs are covered with brown tiles supplied by the Madeley Wood Brick Company, from whom the paving-tiles with which the entrances are laid were also obtained. The floors of all the rooms are laid with blocks of old oak set in pitch upon a concrete bed. The roofs are constructed partly of old oak and partly of fir timbers. All the oak timber re-used in floors and roofs was taken from the buildings formerly covering a portion of the site. There being no grammar school in the vicinity, a separate class-room has been provided for the accommodation of a "grammar class" of the sons of farmers living in the neighbourhood.

THE LONDON TEMPERANCE HOSPITAL, HAMPSTEAD ROAD.

THIS illustration represents the west wing of the London Temperance Hospital in the Hampstead Road, of which Mr. SAMUEL MORLEY, M.P., is president, and Mr. THOMAS CASH is chairman. The memorial-stone was laid by the Duke of WESTMINSTER on April 24, 1884. This wing, which is being built by Messrs. HIGGS & HILL from the designs of Mr. SAMUEL BURBRIDGE, architect, will complete the original plan of the hospital, the east wing having been erected in 1879. The outside walls are built with stock bricks, with red brick dressings, and the present addition to the building will contain accommodation for seventy in-patients, together with nineteen separate rooms for the use of the additional staff, board-room, and nurses' dining-room. A balcony 18 feet wide, running the entire length of the front, has also been provided for the use of convalescents, and special attention has been paid to the ventilation of the building, with the result, it is believed, of making it as perfect as possible. As the ground floor abutting on the busy thoroughfare of the Hampstead Road could not be made available for hospital purposes, it has been devoted to shops, and, as the hospital has no endowment, the rental which it is hoped will be obtained for them, will be a welcome addition to the revenue.

The new wing, which is to cost, exclusive of site and fittings, about 13,000*l.*, will, it is expected, be ready for accommodation early next spring.

HOUSES AT WHALLEY, NEAR BLACKBURN.

THE above houses, illustrated this week, are two of the series of which a drawing of the first appeared in *The Architect* of August 2, 1884. The agent's house is built of rubble stone from Mr. TAYLOR's quarry at Whalley Nab, rough cast with cement and gravel. There is a cavity and brick lining to all outer walls. The dressings are from Waddington Fell quarries. The woodwork—except the porch, which is oak, well oiled—is of pine, painted. The roofs, except porch roof, are slated with blue Welsh slates, with brown-red ridge and hip tiling and finials, from Mr. J. C. EDWARDS, of Ruabon. The porch roof is tiled with plain tiles from Mr. EDWARDS's works. Owing to the plain character of the building, the cost has been very moderate, though nothing necessary for comfort and convenience has been omitted.

The house for Mr. DAVIS is about the same size as the above, but of a different character as regards the exterior walling, which is faced with local parpoints, and the dressings being from the Pendle quarries. The remainder of the work is similar to that in the house above described.

The buildings have been carried out from the designs and under the superintendence of Messrs. STONES & GRADWELL, 10 Richmond Terrace, Blackburn.

SCAFFOLDING, ETC., CREDIT LYONNAIS AND HOTEL DE VILLE, PARIS.

A SALON exhibition would be incomplete if it did not contain a painting in oils of an architectural or constructive subject by M. VICTOR DARGAUD. The artist has made buildings a specialty, but he prefers to represent them in progress. The difficulties which are presented by the timbers of the scaffolding give him opportunities for displaying his skill in perspective and in light and shade. With work of this kind mere sleight of hand will not avail. M. DARGAUD understands construction, and his pictures accordingly give pleasure to contractors no less than to amateurs. His interiors of ironworks and manufactories are equally successful.

## MR. RUSKIN'S LECTURES.

MR. RUSKIN did not deliver the sixth of his series of lectures on "The Pleasures of England" in the Lecture Theatre of the University Museum, Oxford, on Saturday. The subject in the syllabus was "Atheism: The Pleasures of Sense." The Professor said he believed that, although they differed from him in sundry points recently submitted to them, that day they could not but agree with him in this, that the efforts of a paltry British press to reduce lectures prepared only for their hearing to the level of its own understanding, had reduced the reports of his lectures, on which so many of them were unfortunately dependent, into a mass of heterogeneous rabble, out of which it was hopeless to advance a step further. With their permission, therefore, he did not propose for a week or two to deliver the lectures on "Atheism" and "Mechanism," the details of which had so far fluttered the doves of the vivisectionists that they were prepared, if possible, to exercise their newly-acquired rights of the franchise in an encounter with their single-handed antagonist. He hoped to content them that day with some general cleanings up and putting to rights, before going into the series again. In the first place, there was a great mistake in most of the papers about the names of the ships he had mentioned in his last lecture, and the reporters had become confused between the names of the ships and the gentlemen who commanded. The names of the ships he mentioned were the *Captain*, which most of them had forgotten, the *London*, and the *Eurydice*. The latter was a wooden ship—a frigate—and was blown over on her beam ends by one of those fearful blasts which he had described in his essay on Winds; but in all the pictures that he had seen of her she was represented as carrying too much sail—too much sail for a windy day. He had reason also to think that her lower deck doors were open. He did not dwell upon that. His own feeling was that she was carrying too much sail in the pride of her beauty, and, in the modern practice, going as fast and as dangerously as they could to places where they had nothing to do, and where they did not know what to do once they had got there. The *Captain* was an iron ship, known to be top-heavy, and went to sea in spite of warning to that effect. She was caught in the Bay of Biscay, and simply turned bottom upwards, and went down straight, the shrieks of the engineers being heard by two or three of the crew who escaped, as the coals fell upon them red and hot from the furnaces. There was nothing in all the annals of naval disasters so acute and so horrible as that. The *London* simply sank hopelessly and quickly from under her

passengers, because she was waterlogged and the sea dashed over her decks. Why, any fishing-smack would have been perfectly safe in the same position. He would add to those three naval disasters a much more antecedent one—that of the *Royal George*, which was sunk with the greater part of her crew while the captain was writing in his cabin, in the harbour, because a few of her crew were hunting rats half a minute too long in her hull. They had thus four accurate illustrations of a kind of shipbuilding and ship management of which there was no parallel whatever either among the Athenians, the Vikings, the Normans, Carthaginians, or Venetians. These catastrophes belonged exclusively to modern naval history, which had its triumphs, but was darkened by many more shadows than those features which beautified it. The Professor, having made this explanation, stated that he had arranged for the immediate hour a little lecture on "Patience," and then proceeded to read from some of his former works, and concluded by saying that next Saturday he would have the happiness of saying something about glaciers and mountains, and so forth, and would afterwards resume his series of lectures by that on the "Pleasures of Sense."

### PETERBOROUGH CATHEDRAL.

THE works of restoration at Peterborough Cathedral have been suspended in consequence of the Bishop of Peterborough having so emphatically protested against the proposed mode of restoring the cathedral as to threaten to withdraw his promised subscriptions. Dean Perowne has issued a circular in vindication of the Restoration Committee's action. He contends that the raising of the tower, against which the bishop protests, was in the original contract. Mr. Pearson, R.A., the architect, had furnished a design for a very noble tower, and had proposed to restore the discovered fragments of the Norman lantern and a large portion of the Norman arcading. The tower would thus be raised 15 feet, and if it is not done now it will hereafter be impossible, except by adding some incongruous superstructure to the low squat fourteenth century tower. The dean adds that the subscriptions already promised will far more than cover the cost of one stage of the tower, and he urges the speedy removal of the misunderstandings, especially as the works are at present delayed.

### THE RESTORATION OF STRATFORD-ON-AVON CHURCH.

A PUBLIC vestry meeting was held on Monday, in the parish church, Stratford-on-Avon, to receive the committee's report on the proposed works of restoration and the recommendations of the architects (Messrs. Bodley and Garner), who have examined and reported upon the present condition of the building. Mr. C. E. Flower read the report of the Restoration Committee, which stated that shortly after their appointment they invited the Society for the Preservation of Ancient Buildings to inspect and report upon the condition of the church. The society accordingly sent their secretary and another architect, and they afterwards sent in a report on the present state of the church, and gave advice as to the restoration. On almost every point the committee came to the conclusion to follow the advice of the society, and in the only important point on which they differed—the position of the new vestry—after consultation with other architects, they had yielded their views to those of the society. The committee had consulted with Messrs. Bodley and Garner, as professional advisers, during the latter part of their deliberations, and they decided to recommend that those gentlemen be appointed architects of the proposed restoration. A report from Messrs. Bodley and Garner had been already received, and a further report going more into details would be available. The committee recommended, that, subject to such modifications or omissions as might be decided upon, the work proposed to be done by Messrs. Bodley and Garner be proceeded with as soon as the necessary amount—viz., 12,000*l.*—was promised. They recommended that a subscription list be opened, and that as soon as possible a public meeting be called to consider the whole question, and to appoint the necessary committee. Mr. Flower explained that it was proposed to enlarge the Clopton Chapel so as to shew the monuments better, instead of crowding them up with seats. It was also proposed to seat the two transepts, by removing the organ to a place over the tower-arch, and by the erection of a suitable vestry either at the north or south side of the church. The architects also recommended the erection of a second altar and reredos under the tower, the removal of the galleries in the nave, and the reseating of the church on an improved plan. As regards the preservation of the fabric, the architects recommended that the stonework should be carefully examined piece by piece, and that repairs should be done carefully under the personal supervision of some competent person. It was not proposed to have this portion of the work done by contract. The architects' report, a summary of which has already appeared in our columns, was taken as read.—The Vicar moved the adoption of the report.—The Mayor

seconded the resolution, and stated that Sir Philip Cunliffe Owen had kindly consented to act as honorary secretary of the Restoration Fund.—Mr. J. Cox suggested that the work should be kept distinct, as many persons would be ready to contribute towards the preservation of the church as a grand memorial of the past, who might not care to subscribe towards the internal fittings and alterations. The latter was a work which chiefly concerned the congregation and members of the Church of England, and, in any case, he thought the exterior of the church should first receive attention.—Mr. Colbourne (ex-Mayor) said he could not agree to the curtailment of the number of sittings, or to the total abolition of the existing pews, which were very handsome and good in character. He pointed out that out of the 10,000*l.* or 12,000*l.* which it was proposed to expend upon the church, only a trifle over 1,000*l.* was allowed for repairs to the structure. He considered that amount inadequate, and, in his opinion, the outside of the building should first receive attention.—Mr. C. E. Flower said the reason this work was put last in the recommendations, was owing to the inability of the architects to state positively what required to be done, and the probable cost.—The resolution was unanimously carried. Mr. C. E. Flower proposed, "That a requisition be made to the Mayor to call a public meeting, for the purpose of appointing a general committee, and for raising the necessary funds for the restoration and preservation of Stratford-on-Avon parish church."—Mr. Nason seconded the proposition, and it was agreed to, and the meeting shortly afterwards terminated.

### THE STUDY OF ARCHITECTURAL HISTORY.

THE opening lecture of the course promoted by the Dundee Institute of Architecture, Science, and Art was delivered on the 20th inst. by Professor G. Baldwin Brown. The subject was "The Study of Architectural History." Mr. James Maclaren, the President of the Institute, occupied the chair, and amongst those present were Principal Peterson, Rev. Mr. Sugden, Mr. R. Blackadder, Dr. Spence, Mr. R. Keith, and Mr. Charles Ower.

Professor Baldwin Brown said that the few remarks which he should have the honour to offer them that evening had a reference to the work which lay before the Dundee Institute of Architecture, Science, and Art, to which he took that opportunity of wishing a very prosperous and distinguished career, and a useful career, as he was certain it would be. The large scope that the Institute took in its work—embracing, as it did, not only architecture, but all the other arts—was a great feature, and therefore he thought there would be some appropriateness if he offered one or two remarks about the value of keeping up a connection between architecture and the kindred arts of painting and sculpture. In old time the connection between architecture and the other arts of form was much closer than it was at present. The reason of this might partly be found in the spirit in which the arts were now carried on. Architecture, if it were worthy of the name at all, must have about it a certain monumental greatness, while the painter could succeed upon a very small scale of work, and in a purely naturalistic style. The naturalistic spirit which existed in painting, and which every day was becoming more prominent in sculpture, was at the opposite pole to the spirit of great architecture, and the architect and his brother artists, working in different directions, were coming every day to have less and less in common. The result was a severance of the connection between the three great arts of form, a connection which in old time was productive of the happiest results for all the three. Speaking of the advantage of a close connection being kept up between decorative art and architecture, the lecturer said that of recent years many expedients had been tried for the improvement of the decorative work of various kinds which was turned out of our workshops and manufactories. For himself, he believed that nothing would contribute more towards that end than the spread of a sound knowledge of the principles of architecture. The study of the buildings of the past could not fail to awaken a sense of what ornamentation really should be—not a mere external appendage put on anywhere where it would look nice, but something closely related to the structure and to the use of the object to be adorned, something which should be significant as well as beautiful, and should conform to another law than mere caprice. Towards accomplishing this desirable object, industrial museums had done and were doing a much needed and important work, but there was one danger which it would be necessary to guard against if their efficiency as educational institutions were to be maintained at its highest possible pitch—the danger lest the collections should grow too large, and should be selected without due regard to a high standard of excellence. There would be little educational value in museums fitted with a mere heterogeneous collection of objects in all styles and degrees of merit. The collection, therefore, should be select, and there should be a specially prepared catalogue pointing out the merits of each object and what those merits depended on, and showing wherein resided the essential characteristics of different styles. But, whatever could be done by these means, a more solid advantage could, he was convinced, be gained by beginning further back, and by awakening the intel-

ligence of the workman to think the thing out for himself rather than copy the results of others. Such an Institute as that which he had the honour of addressing might do a great work by bringing together men engaged in the different processes of the arts, and by setting before them always a high artistic standard, arrived at by a study of the great works of architecture, sculpture, and painting in the past.

Turning to another aspect of the subject, the lecturer said that if the architect—the true master workman—could supply from his commanding position the principles on which work in the decorative arts should be carried on, he could, on the other hand, receive himself advantage of the highest kind from his connection with the painter and sculptor, from whom, in the present day, he was in some danger of becoming dissociated. This advantage may be summed up in a word. It secured to the architect that he should feel in all he did that he was equally with the painter and the sculptor an artist, and that what he produced was not a convenient heap of bricks or stones, but a work of art. Architecture, as an art, was not a maimed and cramped production. The monuments it had reared in the great epochs of old stood forth clear and perfect expressions of the thought of their Creator. The greatest that sculpture and painting had accomplished was not more purely artistic, more free from any appearance of bondage to mere utility than the achievements of architecture.

The characteristics of architecture, as a true art, as illustrated in the history of the past, was, he afterwards said, the theme to which he would ask them for a few moments to turn. These three points were—First, architecture as an art of expression; second, architecture as the expression of national life; and third, architecture as the expression of great ideas. Under the first head he said it was in the religious festival that man first felt that freedom, that spontaneous impulse towards expression, from which architecture and the arts were born. The treatment by the ancients of their grand buildings rather as monuments to impress the beholder than as habitations or structures for utility conveyed a useful lesson that might be taken to heart, both by those who ordered and those who designed our public buildings. This character of early buildings was commonly emphasised by placing them upon a terraced substructure, the want of which in connection with the Houses of Parliament, and the new Natural History Museum at South Kensington, was shown to be an architectural blunder. Under the second head, he said that in the erection of the Tower of Babel, in the dim twilight before history began, they seemed to see standing out already the great fact to which all artistic history was witness, that a national idea or a common sentiment of a religious or patriotic kind found its most natural outcome in architecture. Again and again had the heart of a people been stirred by some great national undertaking, and they had thrown themselves and all they had into the work. The popular heart still beat as it did when they preached the Crusades and planned the great cathedrals, and when it was reached it was just as responsive. In our own time and country, however, art had no sort of hold upon the popular mind. This was no doubt a legacy to us from Puritanism. The elements which Puritanism had contributed to the national character were amongst the most precious which it enshrined, and he would not echo the cry which was sometimes thoughtlessly raised on behalf of art against Puritanism. Had they to choose between Puritanism and art, they should all rightly hold to the former, but happily no such choice was necessary. It was true that art had in the past not seldom ministered to luxury and pride, but it had also ministered more often and more nobly to religion and the nourishment of great ideas. If they once grasped the truth that art was not a mere plaything or outward adornment, but the expression of the thoughts of great men and of the lives of peoples, then the supposed incompatibility of Puritanism and art would not trouble them. The public history of the past taught us that architecture had in all the great ages of its development drawn its inspiration from the common feelings and aspirations of men—had expressed in every age the special ideas and tendencies of that age; and as each individual had his part in making his age, so he had a part in the production of that art which was, or ought to be, the most perfect expression of an age. To awaken that living personal interest in the members of the public generally in what was going on in architecture and art was one of the highest functions of an Institute like this, and the leaders of the profession had a great obligation upon them to keep up in everything a high ideal, and to preserve their artistic honour unstained. His third point concerned architecture looked at in its highest aspects as the expression of great ideas—as the art which more than any other impressed us with a sense of the sublime through its grandeur, its repose, or its aspiring quality.

The essence of the matter seemed to be that architecture, as it appeared before them in the great monuments of the past, reproduced for us in its own artistic forms the grandeur and beauty of the material creation, affecting us in the same manner as the aspect of nature affected us. Architecture therefore assumed as an art a place of the highest dignity, and the impressions it conveyed blended themselves readily with the emotions of religion. For, as the Hebrew poets reiterated in their magnificent language, these efforts of sublimity, what were they but revelations of the divine spirit which moved through all things? And what was archi-

ture in these aspects of it but a second and in its way equally valid expression of the same divine spirit? The artistic work, therefore, which it fell to an architect to carry out when he strove to make his buildings grand, expressive, and beautiful was a most important element in the higher culture of the human race. Grandeur, secured by greatness of style rather than by mere bulk; simplicity, which gave ever a look of greatness; purity of line on which depended repose; suitability, adaptation to human needs, which did not degrade the art, but rather elevated it through imparting to it throughout a rational character; beauty, gained by disciplining into symmetry and into pattern the flowing curves, the rich complexity of natural detail—these were qualities in work at which the architect as an artist was bound to aim, and in aiming at these qualities he was ministering to the spiritual culture of humanity, and making his work a part of the revelation of God to men.

At the close of the lecture a cordial vote of thanks was proposed to Professor Baldwin Brown, on the motion of the chairman.

## THE EXCAVATIONS IN THE ROMAN FORUM.

IT has been considered necessary to propose the removal of the Church of Santa Maria Liberatrice, which stands between the Palace of Caligula and the Forum in Rome, in order that the building may not be undermined by the excavations. The nuns who own the property have asked a large sum for the church. In the meantime, the works are to be continued by the demolition of the modern granaries, built among and against and almost entirely hiding those magnificent lofty walls behind the Church of Santa Maria Liberatrice, belonging to a grand edifice at the base of the Palatine, regarding which nothing whatever is known, though many different names have been given to it. The clearance at this point will solve a most interesting problem, and doubtless have very important results. As the opening of the new Via Cavour continues towards the Forum, the modern houses between the Curia and the Temple of Antoninus and Faustina, which still cover the remains of the Basilica Emilia and other edifices on that side of the Forum, will be removed, and the excavations there carried to completion. Some little time, however, must elapse before this can be done, and altogether the actual condition of Italian finances, and the greatly increased burdens which the cholera and other disasters have brought upon the country, leave little hope of much progress being made in antiquarian research this winter.

## MASON COLLEGE, BIRMINGHAM.

THE Council of the Mason College are inviting donations to a permanent fund, to be called "The Additional Endowment Fund." The establishment of such a fund is rendered necessary in consequence of the income arising from the landed property and the sums of money with which the late Sir Josiah Mason endowed the college having proved to be insufficient to provide for the annual expenditure, owing to the rapid development of the institution.

The following extract from a circular issued by the trustees will explain in detail the objects of the proposed fund, and will give information as to the position of the college:—

"The late Sir Josiah Mason built a noble college for the advancement of the higher education in this town and district. The structure is admitted to occupy a very high place among buildings devised for this purpose. In addition to the building, which cost upwards of 60,000*l.*, Sir Josiah Mason gave during his lifetime, and bequeathed after his death, landed property and sums of money which produce an income of 4250*l.* per annum. The expenses of general management—*i.e.*, the salaries and wages of the persons concerned in the management of the college (other than the professors), rates, taxes, and insurance, &c.—amount to upwards of 2,570*l.* per annum, and the balance does not suffice for the stipends of the professors. It will be therefore seen that the Council have not sufficient resources at their disposal to enable them to cope adequately with the requirements of instruction, as now understood, either on the science or the arts side of the college.

"1. Scholarships and exhibitions are urgently needed, in order to do justice both to the students and to the academic board. A college unable to grant these valuable marks of distinction labours under serious disabilities as compared with institutions more favourably circumstanced. At present the Council are able to grant only a few book prizes.

"2. Many departments of the college can only be worked efficiently when supplied with a large quantity of costly apparatus. Apart from original outlay, there is a constant depreciation of such apparatus, partly from use, partly from the need of supplying newer and better articles. The Council have hitherto been unable to equip the various laboratories and workshops with many things considered by the professors to be necessary for the due carrying out of their work. In some of these departments suitable illustra-

tions of the lectures can be obtained only from well furnished museums. The college is at present very defective in this point of view.

"3. The Council are anxious to make more liberal arrangements in respect of the staff of teachers, and to make as soon as possible some additions to their number. The Council have regretted the inferior development of the Arts side of the college, and especially the want of Professors of Logic, Philosophy, Political Economy, and Modern History. Experience has proved that the success of a college is much dependent on the provision of a complete curriculum of the arts and sciences.

"4. The desirableness of additional tutorial aid, as regards especially the early examinations, is now engaging the consideration of the authorities. This would involve an annual addition to existing expenditure."

### WESTMINSTER ABBEY.

IN the House of Commons, on the 21st inst., Mr. Cavendish Bentinck asked the Chancellor of the Exchequer whether Her Majesty's Government had undertaken to make any money grant to the Dean and Chapter of Westminster for the general repairs of the abbey church, and the renovation of the north transept, and whether any plans and estimates relating thereto had been submitted to the Office of Works. He had heard that it was proposed that a sum of money should be advanced by the Ecclesiastical Commissioners. He hoped no money would be given to the Dean and Chapter without adequate guarantees as to how it would be spent. He was a strong supporter of the Church, but he had no confidence in the artistic taste of the clergy.

Mr. Illingworth wished to know whether Westminster Abbey was to be regarded as a public building belonging to a national institution, which was to be the object of the concern of the House of Commons. He wanted to know whether there were not sufficient funds in the hands of the Dean and Chapter that were available for the repair of the fabric of the cathedral. On the occasion of the laying of the foundation-stone of the new towers of Peterborough Cathedral, the Bishop of Peterborough had expressed thankfulness that no public money was to be expended on the restoration of that cathedral, and that, therefore, the matter had been kept entirely out of the hands of the Government and of Parliament. Was it asserted that Westminster Abbey stood upon an entirely different footing from any other cathedral, because if it were to be regarded as a public building belonging to a national institution, some forty or fifty other buildings of a similar character and equally deserving of public consideration would have to be dealt with also. He held that the granting of public money for the restoration of cathedrals was altogether out of the question, and he should also object to the funds in the hands of the Ecclesiastical Commissioners being applied for that purpose as long as there were sufficient funds in the hands of the Deans and Chapters to defray the expenses of the restoration of these buildings. Doubtless the Deans and Chapters throughout the country were most worthy men, but they were the most unsafe custodians of public money, large sums having been jobbed away under the pretence of restorations under their management. In his opinion the control of their funds and of the buildings of the cathedrals should be removed from their hands. Would it ever enter the mind of any sane man if the matter were now under consideration for the first time to place the control of these funds in the hands of bodies like the Deans and Chapters? Such control should, in his opinion, be placed in the hands of some authority who would be responsible to that house.

The Chancellor of the Exchequer said that when the estates were re-settled a few years ago the Dean and Chapter of Westminster, instead of receiving a fixed sum, had certain estates of fluctuating value assigned to them to control; and, as salaries and other expenses had to be met, the sum available for the repair of the fabric and to be spent upon the houses occupied by the officials had sometimes fallen to an extremely small one. Last session it was the intention of the Government to introduce a Bill, the leading principle of which was that, instead of the estates being given to the Dean and Chapter to manage, they should receive an annual fixed sum out of the money in the hands of the Ecclesiastical Commissioners, and that this money should be earmarked for special purposes—so much for salaries, so much for services, and so much for fabrics; and that when large works of restoration were to be carried out the Dean and Chapter should have power to mortgage the fabric fund, repaying it in a series of years. That was the proposal which the Government would have brought in at the end of last session, and he undertook now that it should be introduced in the sittings after Christmas, so that it might be passed in the course of the year. The Government could not assume the additional responsibility of providing for the repair of ecclesiastical buildings throughout the country, but he thought the peculiar character of Westminster Abbey placed it in an exceptional position. It was not the intention of the Government to put any fresh charge upon the public.

Mr. Rylands said he agreed with the Chancellor of the Exchequer that the whole of the necessary repairs on the fabric of

cathedrals ought to be provided out of the funds at the disposal of the Ecclesiastical Commissioners and not by means of grants of public money. As he understood that a Bill was to be introduced next session in regard to this matter, he submitted to the Government that in the new arrangements which would be effected by the proposed enactment there should be provided a representative of the Government who in some way or other should have a voice in the management and in the expenditure of those funds.

### MANCHESTER ARCHITECTURAL ASSOCIATION.

THE second ordinary meeting of the Manchester Architectural Association was held at the Old Town Hall, November 25, Mr. Davies Colley in the chair. Mr. J. T. Hodgson read a paper on "Sewage Farms," in which he said:—I have selected this subject with a view of bringing before your notice the means provided for the disposal of sewage and trade refuse, and although it may be outside the general range of subjects for the consideration of architects, it nevertheless constitutes one of the most important problems of the day in connection with sanitary science, with which all architects are expected to be acquainted. It has often appeared to me strangely inconsistent that, whilst so much attention is bestowed on house sanitation, so little thought is given to the ultimate disposal of the filth we are so anxious to get away from the vicinity of our houses, expecting to insure good health in our towns and suburbs by turning the rivers and watercourses into open sewers. It would almost appear that people dwelling sufficiently far from the influence of polluted streams are indifferent as to their condition, although they may be adding to their nuisance. But what is the true benefit of sanitary science if only used for the selfish object of insuring our own comfort and good health at the risk of poisoning others? Sewage farms at one time were looked upon more as the inventions of speculators for the utilisation of the manure than for the speedy removal of the filth from the neighbourhood of habitations, but are now admitted to be the only true means of disposing of liquid sewage from inland towns. These farms may be divided into two classes, the chemical and mechanical: the former, for which there are many patents, is by applying chemicals to the sewage when in tanks, which have the effect of separating the solid and suspended matter from the liquid, which generally requires filtering before passing into the watercourses. The solid matter is sold as a valuable manure. The mechanical is by allowing the sewage to filter through the land. This last system may again be divided into wide surface irrigation and intermittent downward filtration, the former by allowing the sewage to flow over the land, leaving behind the manurial elements to be absorbed by vegetation. In the latter the sewage is applied by running along furrows to be taken up through the roots instead of from the surface, as in the case of the former. These farms are often spoken of in no very flattering terms, but, properly constructed and managed, are very satisfactory. There is great prejudice against sewage farms from the notion they are injurious to health, which is contradicted by the report of the Rivers Pollution Commission, Dr. Littlejohn, Medical Officer of Health to the City of Edinburgh; Professor Christison, President of the Royal Society of Edinburgh; Dr. A. Carpenter, and many others.

A discussion followed, in which Messrs. Davies Colley, Oldham, Brooke, Chadwick, Talbot, Worthington, and Preston took part.

### CELTIC ART.

AT a meeting of the Gaelic Society of London, Adam Street, on the 12th inst., Mr. Thos. Arnold, architect, read a paper on "Celtic Art." After briefly sketching the history of the old Scots in Ireland and Scotland, the author showed that a critical examination of Celtic art pointed to its Eastern origin. The unique character of Celtic art, as exhibited in architectural remains, in splendid manuscripts such as the Book of Kells, &c., in monumental sculptured stones, and in metal work of crosiers, reliquaries, &c., was described in detail with the help of illustrations. Celtic art grew up in the monasteries of Ireland, and was carried by the Celtic preachers wherever they went, as is shown by the abundance of manuscripts exhibiting the purest Celtic ornaments to be found in many of the monasteries of the Scots on the Continent. The Celtic school of design never had, however, a full development. It was questionable whether we could now so catch its spirit as to be able to develop anything out of the very imperfect remains of its architecture; but the school of ornamentation was adapted for the multiform uses in metal work, pottery, glass, &c. The art would remain as the monument of an ancient race long after every scrap of the literature of that period had passed into oblivion. It was one of the most valuable heirlooms bequeathed to our time, and the undeniable proof of the great ability of a race of which the more we know the more are we amazed at the intellectual light they diffused in an age of darkness. There was a discussion, in which Dr. McDonald (chairman), Dr. Cameron Gillies, Major Colin Mackenzie, Mr. Forbes Robertson, Mr. G. Barclay, and others took part.

## THE CITY COMPANIES.

## 3. The Painters' Company.

THE Company of Painter-Stainers is of considerable antiquity. According to Horace Walpole, their first charter, in which they are styled Peyntours, was granted in the sixth of King Edward IV., but they existed as a fraternity in the time of King Edward III.

They were called paynter-stayners because a picture on canvas was formerly called a stained cloth, as one on panel was called a table, probably from the French "tableau." In the inventory of the pictures of King Henry VIII. we find them always so distinguished, as—

"Item, a table with the picture of the Lady Elizabeth, her Grace."

"Item, a stained cloth, with the picture of Charles the Emperor."

The company must have attained some importance in the sixteenth century, for Strype tells us that they were charged with the setting forth of twelve soldiers and all their furniture, though they had neither lands nor revenues, nor any riches to discharge the same; but the amount was levied among the brethren, every man according to his ability. The same author informs us that about 1575 "the Peyntours Company found that their trade began to decay, by reason of other persons that had not been apprentices to it, who undertook painting. Whereby much slight work went off; as pictures of the Queen, and noblemen and others; which showed fair to sight; and the people bought the same being much deceived; for that such pictures and works were not substantially wrought; a slander to the whole Company of Painters, and a great decay of workmanship in the said science; and also a great discouragement to divers forward young men very desirous to travel for knowledge in the same."

In the year 1575 the painters addressed Queen Elizabeth that she would consider their cause, and give aid and assistance to them. Their petition was favourably entertained, for in the year 1581 Queen Elizabeth granted the charter of incorporation which they now possess. It is in Latin, finely inscribed on a good-sized sheet of parchment. On the heading is a well-drawn coloured portrait of the Queen seated, and the royal seal is attached. It is addressed, "Liberi Homines et Cives Civitatis London Artis sive Misterii pictorii vocati Anglice Paynters-Steyners," and is dated "Teste meipso apud Westmonasteriensis decimo novo die Julii regni nostri vicessimo tertio," being the 19th of July, the twenty-third of her reign (1581).

Supplementary to this royal charter is a deed on three large sheets of parchment, also dated in 1581, endorsed, "The book of ordynances for the Paynter-Steyners of London was confirmed and sealed by the Lord Chancellor, the Lord Treasurer, and two Lords Chief Justices," and is accordingly signed by "Syr Thomas Bromley, Syr William Cecil, Lord Burleigh, Syr Christofer Wraye, and Syr James Dyer." To each of the signatures is attached the full coat-of-arms, blazoned in colour.

The charter constitutes and grants the Paynter-Steyners to be a body corporate and politick in art, deed, and name, by the names of Master, Wardens, and Commonality of the Freemen of the Art and Mystery of Paynters, commonly called Paynter-Steyners, within the City of London and the suburbs and liberties thereof; authorises them to have a common seal, gives the usual powers, and specially prohibits "that any person, of whatever estate or degree, shall use or exercise the arte or mystery of the Paynter-Steyners, but only such persons as have been heretofore brought up and instructed by some one of the same arte or mystery as apprentice in the same arte for the term of seven years, under penaltie to forfeit the sum of five pounds."

The charter of Elizabeth enjoins that no native or foreigner shall lay or work anything to be sold with varnish upon any wood, stone, paper, parchment, or vellum that is grounded with any mixture pertaining to the art, or with any kind of colour, oil, size, gum, gleere, glue, except persons who are known to be skilful in the art and mystery and shall be approved and allowed by the master, wardens, and assistants of the company, under a penalty of 40s. Another clause states that no person shall apply any kind of colour upon wood, iron, stone, unless it shall stand and abide the force and extremity of the weather.

That stencilling was sometimes substituted for handwork is suggested by the following:—It is ordained and constituted that no person or persons whatsoever shall devise, make, work, use, exercise, and set to sale any manner of false, deceitful, undue, or unlawful works which shall be wrought with stencil pattern or otherwise as painted and printed sleight upon cloth, silk, leather, or any other thing or things with work of sundry colours or with gold foil or silver foil that is deceitful, corrupt, and unlawful, or which shall differ from the true, good, ancient, and perfect use and manner of workmanship, painting, stayning, or laying of colour.

King James II. also granted a charter to this Company, dated the twelfth day in the first year of his reign, which confirms all the powers of the charter of Queen Elizabeth. It alludes to an "Act of Parliament made at Westminster in the first year of the reign of our Royal Grandfather, King James I.," and recites that "The

Art and Mystery of Paynters is an ancient Art or Mystery, and had time out of mind been an ancient Company and Fellowship in the City of London."

The minute-books, which the Company still possess, commence from the year 1623. They prove how completely the Company was empowered to control and regulate the art of this country. One of their duties, frequently exercised, was to search for work, to judge if it were well or ill done, and on many occasions to condemn it. On March 10, 1673, there is a minute, "That the Painter of Joseph and Pottifer's wife and the Fowre Elements be fined 3*l.* 6*s.* 8*d.* for such bad work."

The Company were also applied to as arbitrators or judges of the value of artists' work, of which there is a remarkable instance, as shown in the minute dated January 11, 1631-2. They had received from the Lord Chamberlain the following letter, dated December 13, 1631:—

"I desire the Masters of the Kings and Queene's barges to cawle unto them the Master and Wardens of the Company of Panter-Steyners in London, and such other discreet men as they shall think fitt of the said Company, to make request of them to view the Kings and Queene's new barges, and to make a trewe valuation and estimate of the woork done by Iohn De Cretz in panting trymmyng and gilding the said barges and certify your knowledge under your hands.

(Signed) PEMBROKE MONTGOMERY.

"Iohn de Cretz, sergeant paynter to the King, demand for two barges, the one for the King, newly done, the other for the Quene repared, the Kings 270*l.*, the other 40*l.*"

The following is the answer of the Company sent to the Lord Chamberlain:—

"The Master and Wardens of the Company of Panter-Steyners of London have received a warrant from your lordship, dated December 13, Ano 1631, to vyew the King and Queene's barges, and to estimate the woork done by Iohn De Cretz sergeant panter to His Majie in panting trymmyng and gilding the sade barges, and to certifie our knowledg therein. We have according to your honour's direction made thereof from able and discreet men of our Company did together view the sade barges, and fynde and testify vnto your honour as followeth, vid<sup>t</sup> that the new pantyng and gilding and trymmyng of His Majie's barge is worth 250*l.* The reparing, gilding, and trymmyng of Her Majie's barge is worth 32*l.*"

There is another minute in the following year showing a similar case, dated January 18, 1632-3:—"At the request of Right Honorable the Lord Goryng the Master and Wardens with certain others of the Company were intreated to vewe a peece of work don by Mr. Buckit at the Lord Goryng's howse beyond St. James's howse, and to give a reasonable estimate of the work, which was performed according to his honour's request."

From an early period down to the middle of the last century, when the Royal Academy of Arts was founded, the Painters' Company included the principal artists of England. In the reign of King Henry VIII., Sir John Browne, John Hethe, and Andrew Wright, sargeant paynters to that king, were liverymen of this Company, as will be shown when we allude to the old hall. In the charter granted by Queen Elizabeth, William Herne, Her Majesty's sargeant paynter, is mentioned as upper warden of the Company. Sampson Camden, who is said to have painted a portrait of Queen Elizabeth, was a liveryman of this Company, and his son, William Camden the historian, and Clarencieux king-of-arms, gave a silver cup in memory of his father.

In the minutes of October 26, 1647, it is recorded that "George Wyld, Doctor of Divinitie, Colonell Richard Lovelace, Thomas Rawlins, Esqre., Graver of his Majie's Mint, and Mr. Peter Lilly, were all made free at this Court." On May 17, 1635, "Mr. Inigo Jones, the King's surveyor, was invited to dinner, and very lovingly came and dined with the company."

In the year 1687 the invitations to the Feast of St. Luke were signed by Anthony Verrio and Sir Godfrey Kneller, with N. Shepherd and Ed. Polehampton. The various pictures in the possession of the Company, many of them of considerable merit, are by artists liverymen of the Company, and mostly presented by them. Sir James Thornhill was on the livery, and Charles Catton, one of the founders of the Royal Academy of Arts, was master in 1761. According to the minute books much business was transacted at the meetings of the Court of Assistants, which were numerously attended. A very kindly feeling appears to have prevailed among the brotherhood: bequests of small sums are recited that the brethren may have supper in memory of a deceased liveryman. The Company are frequently in money difficulties, and members of the Court come forward with loans.

The present Painters' Hall stands on the site of the old Painters' Hall, once the residence of Sir John Browne, sergeant paynter to King Henry VIII., by patent dated 1511, and elected an alderman of London in 1522. He made his will on September 17, 1532, and on the 24th of the same month he conveyed to his brother paynter-steyners his house in Little Trinity Lane, which has from that time continued to be the hall of this Company. The various deeds connected with this property date from the 2nd of King Henry VI., when John de Padyngton gives to

Thomas Wayte the reversion of certain tenements with shops, and the appurtenances in Hoggen Lane and Trinity Lane.

There is no record showing what the old Painters' Hall was like; but in a minute book of the date April 2, 1630, "It is fully ordered and agreed that the wanskotting and beautifying of the hall shall presently be set in hand. . . . For the furtherance of which works there was this day presented to this court a forme and patterns drawn by the care and paynes of Mr. Poule Isaacson, which this court with general good liking approved of." On August 5 following, six or more of the most able and best workmen to be had are ordered to be engaged, and inventions, copies, patterns, and draughts to be provided for them to work from. On August 26 it is ordered that the arms of the livery shall be placed in the hall window, after the fashion of those in the upper parlour, and a remembrance to be made in some eminent place in the hall that this hall was beautified A.D. 1630.

This old Painters' Hall was of some importance. John Evelyn in his "Diary" states that the commission for supporting the sick and wounded in the war had permission to meet there. Under date of November 16, 1664, he mentions, "Painters' Hall was lent us to meete in. In the greate room were divers pictures, some reasonably good, that had been given to the Company by several of the wardens and masters of the Company." They continued to meet there till July 3, 1666, on which day he writes, "Thence to Painters' Hall to our other Commission and dined at the Lord Mayor's." In two months afterwards the old hall was consumed in the great fire of London.

The present Painters' Hall was erected on the site of the old one. It is recorded that the company used Cooks' Hall till their own was rebuilt. On December 20, 1668, there is a minute as follows:—"At a committee for rebuilding the hall, Mr. Bird, master, Mr. Savile, Mr. John Bird, and Mr. Evans. Mr. Luck the bricklayer appeared and agreed to do all the bricklayer's work belonging to the hall for fifty-four shillings the rod, he to find lime and sand and to use all the old bricks on the ground. Mr. Bell the carpenter appeared and contracted to build the hall and front house burnt lately, for 50*l.* a square upon the flatt, he agreed to employ Mr. Luck the bricklayer and to pay him thirty and eight shillings a rod for workmanship. This was agreed to, and the Company to pay him his money as he does his work. Ordered, That the committee meet every Tuesday at 9 in the morning without warning. Ordered, That those persons who are members of the committee and do not appear on Tuesdays shall forfeit 6*s.* for every default."

On August 24, 1669, it was resolved that the plate of the company should be mortgaged in order to raise money for the rebuilding, and several members of the Court lent sums of 50*l.* By the end of the year 1669 the new hall must have been built, as in the February following it was agreed to let the German Protestants have the use of the hall every Lord's day twice, and on every holiday, for two years, at 24*l.* per annum. The "New View of London," 1708, states as follows:—"Painter-Stainer's Hall is situated in Little Trinity Lane. It is adorned with a handsome screen, arches, pillars, and pilasters of the Corinthian order, painted in imitation of porphyry with gilded capitals. The pannels of the wainscot and the ceiling are embellished with great variety of history and other painture, exquisitely performed; as 1st, the portraitures of King Charles II., and his Queen Catherine, by Howsman; 2nd, the fire of London; 3rd, Endymion and Luna, by Palmaitier; 4th, Orpheus fleaing Pan, by Brull; 5th, a piece of architecture, by Trevit; 6th, another, given by Mr. Thompson, the city painter; 7th, Heraclitus and Democritus, by Penn; 8th, a landscape, by Aggas; 9th, fish and fowl, by Robinson; 10th, art and envy, by Hungis; 11th, a piece of birds, by Barlow; 12th, a piece of fruit and flowers, by Everbrook; 13th, a ruin, by Griffier; 14th, Cambden's portraiture; 15th, a piece of birds; 16th, the ceiling is finely painted with Pallas triumphant, with the arts and fame (attended by Mercury) suppressing their enemies, sloth, envy, pride, &c., done by Fuller; and there are several other pieces in the parlour." The ceiling decorations above described unfortunately no longer exist, nor is it known when they were destroyed. The pictures, the gifts of artists, former liverymen of the company, still hang upon the walls, and serve to illustrate how intimately the guild was associated with artists in the olden time.

The freedom of the company is obtained on election—(1) by patrimony granted to the sons of freemen born after the admission of their fathers into the freedom of the City; (2) by servitude granted to apprentices who have duly served their time; (3) by redemption on paying an increased fine to the company; and (4) by gift as by redemption, the parties not being otherwise entitled, the company paying the fees and stamps. The livery of the company is obtained on election by any person having the freedom.

The leading members of decorative painting do belong to the company, and fifty-five members are in the painting trade. No power can be found to disfranchise a freeman. Females are entitled to the freedom of the company, but no female has now the freedom. Every person is qualified to be elected to the freedom or livery of the company upon being proposed, seconded, and elected by the Court.

There is no fee, reward, perquisite, profit, or emolument, directly or indirectly, attached to membership, except that two decayed

liverymen and ten poor lame painters are eligible for Mr. Stock's charity of 10*l.* annually, and except the poor-box supported by voluntary contributions, and Mr. Fairchild's legacy, distributed to the widows and orphans of past members in sums varying from 30*s.* to 4*l.*, poverty and respectability being the only further qualifications.

The members of the livery are entitled to vote for Lord Mayor, sheriffs, chamberlain, bridgemasters, and other City offices, at the common halls at Guildhall, and at all elections of master and wardens of the company at the common hall on October 18. The average standing of a liveryman when he is elected on the Court is about ten years, and, unless he resigns, he remains after election a member of the Court for the rest of his life, subject to certain restrictions.

## LIGHTHOUSE ILLUMINATION.

WHEN the experiments on lighthouse illumination were undertaken a few years ago, we wrote in strong terms condemning the difficulties which were raised by officials in dealing with the inventions of Mr. John R. Wigham, of Dublin. His system of oil-gas was found to be most applicable for lighthouses, but it could not overcome the obstacles created by the circumlocution offices. The following letter from Professor Tyndall, who found himself unable to secure fair play for Mr. Wigham, and therefore resigned his appointment, will bear out the strictures which were passed in this journal on the case, and which at the time may have seemed to be over-severe:—

It goes against me to charge Mr. Chamberlain with theft, even in "a metaphorical sense;" but most assuredly he has stolen my thunder. He poses as a "protector," knowing right well that the head and front of my offending was my effort to protect from official extinction an able and meritorious man, who had the misfortune to raise a rival at the Trinity House, and to ruffle the dignity of the gentlemen of the Board of Trade. Struggling single-handed, relying solely on his own industry and talents, and with no public funds to fall back upon at pleasure, Mr. John Wigham, to whom I here refer, during the brief period of his permitted activity, had made advances in the art of lighthouse illumination which placed him far ahead of all competitors. This man I did my best to protect from the effects of professional jealousy and bureaucratic irritation. My reluctance to draw too heavily upon your good nature alone prevents me from offering a condensed history of Mr. Wigham's labours, and of my relation to them, for publication in the *Times*.

It was my earnest desire to utilise Mr. Wigham's genius for the public good. It was the object of officials whom he had offended to extinguish him. They did what they could to weary him and worry him and take the heart of enterprise out of him, and they certainly succeeded in checking the development of his system of lighthouse illumination. Had it not been for an opposition which, considering the interests at stake, seemed to me at times criminal, that system would assuredly be far more advanced than it now is. His rival was encouraged to push forward, while he was held back. The boldest attempt made against Mr. Wigham was the appropriation of his invention of superposed lenses for the new Eddystone lighthouse. This high-handed proceeding would have provoked litigation, had not the Elder Brethren, reverting to their more generous instincts, lately taken a more reasonable course than that which their engineer first advised them to pursue. A compensation of 2,500*l.* was offered to Mr. Wigham, and eventually accepted by him. This outlay, I may remark, would have been rendered entirely unnecessary by a wiser mode of action. The reasonableness of the Trinity House was not, however, shared by the Board of Trade. Mr. Chamberlain, as a man of business, ought to have known the advantages of healthy rivalry. He ought to have known that the activity in regard to oil lights, displayed of late years at the Trinity House, is to be traced to the stimulus furnished by the gas system. Were he a man of juster temper he would have found room for both. Instead of this he tried hard, not only to wipe out Mr. Wigham's claims for the past, but, by depriving him of all incentive to further effort, to abolish him for the future. With regard to the President of the Board of Trade and his officials, the Irish inventor writes to me thus:—"They grasped not only the Eddystone invention, which was all that the Trinity House asked for when they offered the 2,500*l.*, but all my patents and inventions connected with lighthouses, whether tried or untried. It was with great difficulty that I got them to consent to allow me to hold the proprietorship of my own thoughts for the future; but very shame, I suppose, caused them at last to relinquish that claim." If this be true, it is less the alleged injustice to Mr. Wigham than the attempted suspension of energies so competent to work for the well-being of the sailor that deserves reprehension.

Between truth and untruth there lies a penumbral zone which belongs equally to both; and I have often admired the adroitness with which Mr. Chamberlain sails within the "half-shadow." He sometimes, I fear, crosses the boundary on the wrong side. He describes me as being "at issue with the most experienced practical authorities." Never was there a consensus of practical

authorities more overwhelming than that which I have vainly laid before Mr. Chamberlain. His "practical authorities" are officials, some of them pecuniarily interested in this question. My practical authorities are men dependent on the beacons of our coast for the security of their own lives and the lives of those committed to their care. Permit me to lay before you a few samples of the testimony voluntarily offered by the commanders of the great Atlantic steamers with regard to the lighthouse, arranged and lighted on Wigham's principles, on the dangerous cliffs of Galley Head. One captain calls it "the most marked and unmistakable light" he ever saw; another calls it "a splendid light, easily distinguished by its marked character"; another calls it "a most strongly marked and appropriate light"; another describes it as "a most excellent light, which can be easily distinguished from every other light on the coast." Such was the evidence unanimously given in favour of the light when it was first introduced. Five years after its introduction, Messrs. Ismay, Imrie & Co., on being asked whether they still retained their favourable opinion of the light, reaffirmed that opinion by pronouncing it "the very best light upon the coast." It is the inventor of this light whom our officials, only too successfully, have sought to paralyse.

Before the first Illuminants Committee appointed by Mr. Chamberlain had been swamped by his later despotism, some fear was expressed at one of our meetings that the expense of the experiments proposed to be made at the South Foreland would be considerable. The chairman of the Committee, however, informed me that the Assistant-Secretary of the Board of Trade, on being told that the inquiry would cost 4,000*l.*, had replied that money was no object, and that the sum mentioned would be forthcoming when required. I could not help contrasting this lavish liberality with the small economies practised in Ireland. But will 4,000*l.* cover the experiments at the South Foreland? If not, how much more will be needed to cover them? To be worth anything they must be continued through the winter. What will be the bill afterwards? The Illuminants Committee broke down. What check in place of it has been brought to bear upon the expenditure of the Trinity House engineer, who has had the public purse open to him during all these months? To me Mr. Chamberlain's talk about expending public money savours of humbug.

With regard to Mr. Chamberlain's charge against me, of having indulged in "unworthy and ungenerous insinuations," those who know both him and me will laugh at such a charge. I do not deal in insinuations. When I repudiate and oppose the mean and grinding despotism which he would introduce into official life, I speak to him, and of him, not by insinuation, but with honest plainness of utterance.

### WESTMINSTER HALL.

THE following letter from the Rev. W. J. Loftie, the author of a history of London, has appeared in the *Times*:—Westminster Hall is, in part at least, as old as the reign of Edward the Confessor. In his reign it must have stood close to the edge of the Thames, and if any side was exposed to view it was the eastern, and not, as at present, the western. Then, and for centuries afterwards, the western side was in a court, in which court, during and after the reign of Henry III., if not long before, the kitchen was situated. The buildings on this side at first connected the Hall with the Abbey, and though we cannot tell when they were disconnected by the thoroughfare called afterwards St. Margaret's Lane, we know that it was long subsequent to the founding of the palace. This is evidenced, if evidence is wanting, by such a local name as New Palace Yard. As to the exact shape, size, and number of the buildings which intervened between the Hall and the Abbey it depends on the period to which we refer. As the land on the east side was reclaimed it became gradually more possible to build; and I believe that while the palace of Edward the Confessor was mainly westward of the Hall, that of, say, Richard II., was mainly on the eastern side towards the river. But the old courtyards between the Hall and the Abbey continued to exist, in spite of numerous alterations. Mr. Pearson gives a detailed account of the buildings erected here under Queen Elizabeth. The point, however, which I want to insist upon is so important that I deny myself the temptation of dwelling on this most interesting passage of the report of July 15. I want to make it perfectly clear that, except during the time the now removed law courts were in process of construction, the western side of the Hall was never exposed to view from the street, and whatever buildings stood against it were in courts of great irregularity, almost as if they had been purposely designed to mask the ugliness of the long roof.

The object of bringing out this point as clearly as possible is that, once admitted, it deprives Mr. Pearson's design of any right to be called a "restoration." Mr. Pearson cannot call anything a "restoration" which not only introduces into the view a wholly new feature that at no former period, near or remote, formed any part of it; but which also offers us such a long perspective of the roof of the Hall itself as it is perfectly certain the original architects carefully avoided.

With this initial objection to Mr. Pearson's design, it is hardly necessary that I should examine the report more minutely. Still, if you will allow me space, I think it should be pointed out that though Mr. Pearson finds foundations of the thirteenth century, and though he proposes to place on them a building in the style of the fourteenth, no "restoration" can be intended; for where we know that apartments existed, some of considerable size and at right angles to the axis of the Hall, Mr. Pearson offers us an open cloister on the ground floor extending the whole length of the building, with the alternative of a similar building glazed. Mr. Pearson speaks of "divers lodgments" of the time of Richard II., the time, that is, which he professes to have chosen, and yet these chambers between the buttresses are to be "restored" into a long, continuous, and undivided carriage shed. With regard to the windows, Sir Christopher Wren, in a sketch, shows a view of some which were in this part of the building. There were "two in two of the bays, but the internal arrangements of the rooms rather point to these being later insertions." These are Mr. Pearson's words. If this design is to be a "restoration," how can we reconcile them with the existence of windows in pairs all along the new building? Again, Mr. Pearson says, enigmatically, "but little of the restoration is conjectural." Now, by his own showing, with the exception of the height of the wall, and the probability that the parapet was embattled, it is not only all conjectural, but, as I have pointed out in the matter of the windows, it is contrary to the few facts we do know.

One word, in conclusion, as to the towers at the northern end. All the evidence we have shows them to have been always much as they are now. But Mr. Pearson condemns them as having "an air of spuriousness." He proposes to rebuild them, adding greatly to their height. According to the thorough-paced restorer, therefore, it is better to be spurious than to seem so. It is better actually to falsify the history of a building than to leave on it a very slight suspicion of such a falsification.

### ROMAN BATH.

A PAPER was read by the Hon. and Right Rev. Dr. Clifford, Bishop of Clifton, at the Literary and Philosophical Association of Bath, on "The Vicissitudes of the City." According to the report in the *Bath Herald*, the bishop said that the hot springs were no doubt the inducement which led the Romans to Bath, but the origin of the town itself might be accounted for in one of two ways. Either the Romans built a town and then adorned it with baths, or else they, in the first instance, erected baths, round which a town sprung up, on which in progress of time was conferred the privilege of a Roman colony. This latter course was the one that most probably was adopted. After describing Roman baths as establishments which were not exclusively devoted to bathers, but as having halls for training purposes and instructions of various kinds, and as being frequented by philosophers, rhetoricians, lecturers and their disciples, Bishop Clifford said it seemed highly probable that the enclosure which marked the walls of Mediæval Bath was in its first origin not the wall of a Roman town, but the enclosure of the thermæ. That at a later day (still during the Roman period) they became utilised as walls of the town he thought was true. The nine colonies in Britain were not all established at once, but by degrees. The military colonies were settled first. Bath, a civil colony which owed its promotion, no doubt, to the interest of the many influential persons who had chosen it for their residence, was amongst the later ones. Tacitus mentioned baths as one of the institutions to which the Romans had recourse in order to teach the Britons to adopt the manners of Rome. No baths in Britain could bear comparison with those of Bath. Bath, therefore, in this respect must have stood foremost amongst the centres of civilisation in Britain. The period comprised between the latter portion of the second century and the early part of the fourth—from the Emperor Severus to the Emperor Constantine—was that of Bath's greatest prosperity. The baths must then have been seen in all their splendour; the colony had reached its largest dimensions. Not only were there numerous Christians in Bath in the second and third century, but the public use of pagan worship had been abolished, and Christian worship had been publicly and officially established in Bath under Roman rule, well nigh a century before the Romans departed from this country. On the first establishment of Christianity under Constantine a destruction of pagan temples on a large scale took place. The temple of Minerva at Bath, though probably not destroyed, was certainly deserted, and was either allowed to fall into decay or (which was not improbable) was utilised for secular purposes. Another change, small in itself, but which was interesting in connection with the history of Bath, must have taken place about this time. With the cessation of the worship of Minerva the name of the goddess began to be dropped in connection with the name of the town. Aquæ Sulis gradually became simply Aquæ or Aquis; this at a later period gave rise to the British form Ack-man, and Cair Ack-man, which the Saxons translated Bathumchester, whence the modern name, Bath. Contemporaneously with the establishment of the Christian

religion they found that the great Roman baths, both in Rome and throughout the empire, began to fall into disuse, the buildings being not unfrequently diverted to other public purposes. Something of this kind must have happened in regard to the thermæ at Bath. Speaking of the subsequent invasions of the barbarians, he said the defences of Bath were not confined to its walls. The whole of the magnificent structures which had been raised at the baths as monuments of taste and splendour were pressed into the service for the defence of the British stronghold. The ruin of Roman Bath was as utter as that of Tyre.

The models of the baths, which were exhibited at the Health Exhibition, are to be shown at New Orleans, with the assistance of Major Davis, the city architect, under whose directions the models were constructed.

### THE NEWLANDS MILL CASE.

ON last Saturday afternoon, at the Bradford town hall, Mr. Henry Mitchell and Mr. Robert Sutcliffe, assisted by the town clerk (Mr. W. T. McGowen), distributed to thirty-two persons the sums awarded to them as the result of arbitration as compensation for the losses and injuries sustained by the fall of Newlands mill chimney in December 1882. For some time past the mayor and Messrs. Mitchell & Sutcliffe have been engaged in bringing about an amicable settlement, the result of which is that they have decided upon between ninety and one hundred cases, the aggregate sum awarded being about 2,500*l.* About thirty of the representatives of these cases assembled in the Borough Court, at the town hall, on Saturday afternoon, and after being addressed by the arbitrators, about 1,500*l.* was distributed among them. No date has been fixed for paying over the remaining sum, but it is intended that there shall be as little delay as possible. Addressing the assembly, Mr. Mitchell said that between 2,000*l.* and 3,000*l.* had been paid by Messrs. Ripley for funeral and medical expenses, and with regard to the 600*l.* for law expenses to which those present were liable for their share, he had collected nearly the whole amount, so that they could receive the awards clear.

#### The Bombay Municipal Buildings Competition.

SIR,—Will you do me the favour of permitting me to acknowledge through you the receipt of the following competitive designs for the new Bombay Municipal Buildings?

##### Motto or Device.

1. Kohinoor. (A)
2. "A thing of beauty is a joy for ever."
3. Drawing-pen.
4. "Corinthian grace to nought gives place."
5. Audaces Fortuna juvat.
6. Queen-Empress.
7. "Where gleam and gloom their magic spell combine."
8. Chiban.
9. Ferio tego.
10. Stet Fortuna Domus.
11. (X)
12. Kohinoor. (B)
13. Bullseye.
14. Perseverando vinces.
15. (R)
16. Utility.

I have the honour to be, Sir,  
Your most obedient servant,  
E. C. K. OLLIVANT,  
Municipal Commissioner.

No. 8,132 of 1884-85.  
Municipal Commissioner's Office, Bombay:  
November 6, 1884.

#### Awards for Ventilators at the Health Exhibition.

SIR,—We observe in your issue of this week that our statements with respect to the non-invitation of certain exhibitors of ventilators to the testing, and the farcical nature of the tests, are fully corroborated by other exhibitors who were also *not invited* to the tests. On the face of this, how can it be asserted, as it is, that *all* were invited?

The more light that is thrown on this lamentable fiasco shows but all the more conclusively that there has been, to put it mildly,

sad mismanagement somewhere, and it is only right, seeing that this is a public matter, that the public should know who is responsible for it, and also that measures should be promptly taken to secure the rectification of the blunder which has been committed, otherwise a lasting reproach will not only rest upon the conduct of Jury 10 and their testing engineer, but upon the Health Exhibition itself, and an injury will be done to the cause of sanitary science by bringing it into ridicule and contempt with the public, that will take many years to eradicate.

As showing the opinion of the press in the matter, we beg to give an extract from a lengthy "leader" which appears in this week's *Health*, by the editor, Dr. Andrew Wilson, F.R.S. :—

In view of the remarks of Messrs. Boyle & Son, published in our present issue, it would appear that some strange mismanagement has overtaken the jury which decided the "Ventilation" awards at the Health Exhibition. If, as Messrs. Boyle say, their well-known ventilators were not included in the list of apparatus tested, and if their position as competing exhibitors has thus been practically ignored, we certainly feel entitled, in the interests of "fair play and no favour," to ask for an explanation of these anomalies. We approve of the demand of Messrs. Boyle not only on account of the alleged grievance of that firm alone, but of all other firms who have competed in the section alluded to, whether they have received awards or not. No firm of inventors can have the slightest satisfaction in receiving any award the fairness and impartiality of which can be called in question. We are certain, therefore, that we only re-echo public sentiment and professional opinion when we ask that such a matter as that to which attention is being directed should be fully investigated. If exhibitions and their juries do not obtain the confidence of the public, the main stay of these institutions is at once sapped and destroyed.

A leading London editor, writing us on the subject, expresses his surprise at such "hankey-pankey doings in an exhibition that is royal, and should be loyal," and says "if exhibitions are to be conducted in that way it would be wiser to stop them."

A correspondent who signs himself "An Architect," says "it is to be regretted that gentlemen more practically scientific were not appointed to adjudicate on ventilators at the Health Exhibition." And he further asks, referring to the tests, "Could any greater farce, in the name of Science, be enacted?" All that we can say in reply to this query is, "Time will show." We believe, after what we have seen, that anything is possible in these days.

Yours, &c.,

ROBERT BOYLE & SON.

64 Holborn Viaduct : Nov. 22, 1884.

SIR,—We trust you will accord us similar courtesy to that extended to other correspondents respecting above. As winners of the gold medal for roof ventilators, we naturally expected that our good fortune, whether merited or not, would be hardly acceptable to those who consider their goods depreciated by such result. Is not, however, this feeling carried too far, when one of your correspondents suggests collusion between the tester and some gentleman on the jury inimical to the firm in question, with a view to exclude their goods or procure the award for another firm? Supposing, for the sake of argument, the testing was inefficient; surely the tester does not forfeit his right to be considered a gentleman? With reference to the testing itself, we presume our ventilator showed better results than those of others competing, or we should not have obtained the award. Is it not common sense to assume that with, if possible, stricter and more reliable tests, we should still be ahead with better proportionate results? We do not wish to be self-assertive, but we fail to see that a bad method of testing must act in our favour and detrimentally to every other maker. Mr. Buchan, for instance, considers he should have shown a better result with a smaller ventilator; some of the ventilators tested, however, must have been similar to this smaller size, but apparently they were not benefited.

We are informed by one of your correspondents that the holder of a silver medal claims the highest award for roof ventilators, on the ground that the gold medal was given for a chimney cowl, which is also referred to by another as an antiquated cowl of twenty-five years ago. These remarks are made for the evident purpose of damaging us and depriving us of any benefit to be derived from the award, and but for them it is unlikely we should have troubled you with this letter. In the first place, we receive the gold medal under class 25, inlet and exhaust ventilators, and no one with an inferior award can claim the position it gives our exhibits under that class. With reference to the object tested, we have used the same pattern in numerous instances for roof ventilators. It is the same in every respect as the Turret ventilator exhibited at our stand, and all the ventilators which we have brought out from time to time are variations in form of exactly the same principle, to suit various styles of architecture as required. This principle was patented by Mr. James Kite, the father of the present head of our firm, and is, we believe, the root of most ventilators at present before the public. If, as Mr. Boyle says, the length of time the public have appreciated his goods is the best test, he cannot surely find fault with us, that after so many years of fancied improvements, modifications, &c., of our original patents

by others, our goods still retain a hold on the public, and have carried off the most important award of recent years. The question of cost, which has not transpired in this correspondence, we also consider a most important factor. If our ventilators did not excel those of other competitors, but equalled them, still, as they are one-third the price, it is to the advantage of the public to support us. We notice a term used, "injuring the cause of sanitary science." Is it possible these gentlemen are all fighting for the benefit of sanitary science, or is it not more natural to consider them as 'cute business men who consider a matter of this kind a capital opportunity to damage a successful rival and at the same time get a free advertisement? It seems to us the mistake they make is that your readers will judge the value of the award by their very apparent vexation at losing it. We are confident of one thing, whatever the tests and whoever had won there would have been a similar outcry from the majority losing; and this would have been much more reasonable if the award had been made without a test. There have been numerous so-called contests, competitions, &c., where the prize has been awarded for what?—a well-displayed stand, or perhaps the magnetic effect of well blended colours, but certainly on no mechanical or scientific test. The result has been blazoned about—gold medal, highest award, &c.; but is not this more absolutely unfair to the defeated competitors than the method respecting which there is so much indignation? Apologising for the length of our letter, which is not an advertisement but merely a protest against the bitterness which your correspondents manifest—certainly undeserved by us and unnecessary in the "interests of sanitary science,"

Yours faithfully,

C. KITE & Co.

Christopher Works, Chalton Street,  
London, N.W.

P.S.—We shall be pleased at any time to take part in any testing where the conditions are the same for all and the tester independent, such as we understand the Sanitary Institution of Great Britain intend instituting.

SIR,—I am glad to observe a correspondence going on in your valuable columns respecting the value of the tests made with ventilators at the late Health Exhibition, as I think the question is one the discussion of which will be of value to the public, as tending to show the unreliability of all such tests and their misleading nature.

I consider that all such so-called scientific experiments which have been, or may be, instituted, can no more demonstrate satisfactorily the relative value of different cowls than they can prove that a plain open pipe is better than a pipe with a cowl on the top of it, and for the following, amongst many reasons that might be given, viz.: within these last seven years I have seen the accounts of at least a score of testings, conducted by different individuals and scientific bodies, and upon comparing the figures given I find that in no two cases do the results agree. A ventilator that in one table of figures is shown as being very powerful and free from down-draught, in other tables is put down as very feeble and subject to strong down-draughts, and ventilators that appear in the first table as practically useless are shown in other tables as highly efficient. The notorious "Kew" experiments, and those now under discussion, are striking instances of what I describe. Now, the important question arises, which of all those conflicting tables is to be accepted as correct, and how is it to be *proved* that the one selected is the *correct one*? I leave this problem for your readers to solve, as I have utterly failed in the attempt myself.

Yours, &c.,  
SCEPTIC.

## ART WORKMANSHIP.

**Worcester.**—The interior of St. George's Catholic Church has been redecorated at a cost of about 300*l*. The old chapel was decorated originally by Owen Jones, before 1851; and so well was the work done that certain portions of the gilding and decoration of the roof have been left untouched in the present restoration, but so blended with the new work that it is impossible to detect them. The chancel and the two side chapels were built about five years ago, and are of the Italian style. The plan in the present decoration has been to combine the old work with the new by a careful harmony of colour and design. Between the windows in the main body of the church are portraits, more or less authentic, of Worcester priests of the seventeenth century, painted by Mr. Goldie, of London. Over the entrance to each of the two side chapels are angels painted on gold backgrounds, with mottoes. The gas standards are by Messrs. Goodman & Ward. The whole of the decorations have been designed and carried out by Mr. R. J. Hopkins.

**The Hooker Window.**—The stained glass window, erected in Bishopsbourne Church, as a memorial of Richard Hooker, the author of "The Laws of Ecclesiastical Polity," has been unveiled. The glass has been executed in accordance with the style of art

prevalent during the fourteenth century, so as to be in keeping with the architecture. The pictures are placed beneath canopies, the whole effect being rich in colour. The window is a large one of five lights, and the subjects illustrate incidents from the latter part of our Lord's life, beginning, in the left hand light, with the *Entry into Jerusalem*, and continuing with *The Last Supper*, *Agony in the Garden*, *Bearing the Cross*, *Crucifixion*, *Taking Down from the Cross*, *Entombment*, *Resurrection*, *Descent of the Holy Spirit*, and finishing in the upper part of the centre light with *Our Lord in Majesty*. In the lower part of the window is a predella of smaller subjects, forming types of those above, viz., beginning from the left hand, *The Manna*, a type of the Last Supper; *Isaac Carrying Wood*, of the *Bearing the Cross*, the *Passion*, of the *Crucifixion*, *Joseph being Lowered into the Pit*, of the *Entombment*, and *Elijah's Cloak Falling upon Elisha*, of the *Descent of the Holy Spirit*. The memorial inscription runs as follows: "In mem. Ricardi Hooker hujus. Eccle. Rect. obt. A.D. 1600." The work has been designed and executed by Messrs. Lavers, Westlake & Co., of London, at a cost of about 400*l*.

## ARCHÆOLOGY.

**Ancient Hackney.**—The extensive and valuable collection of ancient books, deeds, maps, and other documents, forming an almost complete historic record of Hackney, from the days when it was a mere "village neare London" to the present time, has been handed over by its donor, the Rev. R. D. Tyssen, rector of South Hackney, to the special committee appointed by the Hackney Vestry for its reception. One of the large rooms in the town hall has been set apart for the purpose, and as soon as the preparation of the catalogue, itself no inconsiderable task, shall have been completed, the library, under certain regulations, will be open for inspection and reference by the parishioners of Hackney on Tuesday evenings. The vestry has resolved to effect an insurance on the library of 1,000*l*., but that amount does not represent the value of the documents, which Mr. Michael Young, chairman of the committee, describes as "above price," and will prove of the utmost service to local historiographers.

## LEGAL.

**City of London Court.**—November 24.

(Before Mr. COMMISSIONER KERR.)

LEAMING v. DE BEARNE.

This was an action brought by Mr. Leaming, of the Poultry, City, for 11*l*. 16*s*., for work done as a surveyor for Prince De Bearne, of Members' Mansions, Victoria Street, Westminster. The plaintiff stated that he got the order from Mr. Butler, the Prince's architect, to do certain work as a surveyor at Members' Mansions, the freehold of which the Prince had bought. He did it, and had sent in his account, but had not been paid. Mr. Butler, the architect, said he saw the Prince on February 9, 1883, at the Craven Hotel, Craven Street, Strand, when he told witness that he was purchasing the freehold of Members' Mansions. When it was completed, Captain Ross would be his agent, and he (witness) was to act as architect. He also saw the Prince in October last at His Highness's residence in Paris. The tradesmen's accounts were placed before him, including the plaintiff's. Cross-examined: He was suing the Prince himself for work done. The learned Commissioner said he had no evidence that the plaintiff was ordered to do this work by the defendant. In order to do this work the plaintiff would have to show some express or implied authority. There was none here, and he must enter a common law nonsuit.

## CHURCH BUILDING AND RESTORATION.

**Bolton.**—The corner-stone of a new vicarage for St. Mark's church has been laid. The building will be a substantial structure in the Early English style of architecture, and built entirely of brick with terra-cotta facings. The interior woodwork will be of varnished pitch pine. The architect is Mr. Marshall Robinson, and the contract, let for a sum of 1,700*l*., is in the hands of Mr. John Roberts, of Bolton.

**Chorlton.**—The new church of St. Ambrose, Chorlton-on-Medlock, has been opened. The church is of brick, and has been designed in Early English style. It consists of nave and aisle, chancel and chancel aisle, and vestries, and will seat 400 persons. The architect is Mr. H. C. Charlewood, and the contractor Mr. R. Carlyle, of Manchester.

**Croydon.**—A Congregational church is about to be erected in the London Road, West Croydon, for the Rev. J. P. Wilson, from designs prepared by Mr. W. D. Church, architect, 12 South Place, Finsbury. Accommodation is to be provided for about 1,000

persons. The building will be in the Early Decorated style of Gothic architecture.

**Frindsbury.**—The ancient parish church, which dates back to Norman times, has been reopened after restoration and enlargement, at a cost of 5,000*l*. Mr. Bunning, London, has carried out the work from the designs of Mr. J. L. Pearson.

**Hanley.**—The memorial-stone of a Presbyterian church has been laid. The building will be of brick and terra-cotta, with tiled roofs. The architect is Mr. G. W. Bradford, of Hanley, and the builder Mr. George Ellis.

**Edinburgh.**—The memorial-stone of a new church in Drum-sheugh Gardens, has been laid. The church is estimated to cost about 16,000*l*. The architects are Messrs. Campbell-Douglas & Sellars, Glasgow.

**Enfield.**—The memorial-stone of a mission hall at New Lane, Enfield, Middlesex, was laid on Tuesday afternoon, at four o'clock, by Mr. J. Holborn, J.P., Chairman of the Congregational Union. The architect is Mr. W. D. Church, of 12 South Place, Finsbury, and the builder is Mr. E. Linson, of Kensington.

### WORKS IN PROGRESS.

**A Large Consignment of Church Furniture**, including choir stalls and eagle lectern, has just been shipped for use in Christ Church, Georgetown, Demarara, by Messrs. Jones & Willis, of Birmingham and London. They have also in hand, for Holy Trinity Church, Ilkeston, a very handsome pulpit and font.

**The Patent System of Wood Block Flooring**, of Messrs. Geary & Walker, Manchester, has recently been adopted for the following buildings:—Bromley and Beckenham Joint Hospital; Harrow Public School; Southport Convalescent Hospital; Church of The Sacred Heart, Exeter; St. Gabriel's Church, Middleton; Shilbottle Church, near Newcastle; St. Barnabas' Church, Crewe; Stuckey's Branch Banks at Weymouth and Tiverton; St. Michael's Parish Church (restoration), Macclesfield; St. Barnabas' Church, Blackburn; Schools at Swindon; Savings Bank, Hull; Northgate End Chapel, Halifax; Bishop Canning's Church (restoration), Devizes; Presbyterian Church, Lanark; High School, Dunfermline; Offices, Tithebarn Street, Liverpool; "The Uplands," Brighton, for Mr. P. A. Taylor, M.P.; Glossop Hall, for Earl Howard; Roman Catholic Institute, Dublin; Independent Schools, Delph; Offices for the Tyne Commissioners; and The Ladies' College, Ashton-on-Mersey.

### GENERAL.

**Mr. Holman Hunt** has completed the copy of his important picture, the *Flight into Egypt*. The original canvas becoming defective, a piece was inserted, and there are consequently two paintings of the same subject.

**A School of Art for Dumbarton**, a gift to the burgh on the part of several of the citizens, was inaugurated on Tuesday.

**The Committee of the South African Industrial Exhibition** in Cape Town, after payment of expenses, have been enabled to hand a "handsome bonus" to the secretary and architect, and to place 100*l*. in the Standard Bank as the nucleus of an exhibition fund.

**Mr. Whistler** has been elected a member of the Incorporated Society of British Artists.

**Mr. North**, of Rowley Regis, an old pupil of the Wolverhampton School of Art, has sent a sum of 10*l*. towards the fund for acquiring works for the art gallery. This donation has suggested the starting of a movement for inviting the active co-operation of past and present students of the School of Art in support of the art gallery fund.

**A Committee** has been formed for the purpose of relieving the distress which prevails among the Neapolitan painters, sculptors, and bronze-workers. It is proposed to solicit commissions for statuary, copies of frescoes, &c., which will be carried out at a great reduction on the usual prices.

**A Conference of Artisans** was held at Anderton's Hotel, Fleet Street, on Monday, at which it was suggested "that the system of apprenticeship where it exists should be adapted to the modern conditions of industry, and that employers, in taking apprentices and youths into their service, should undertake to see that they attend technical classes a certain number of hours weekly; and, further, that previous to their becoming journeymen their employers should invite them to pass an examination to test their efficiency."

**The Leith Improvement Scheme** is now being carried out, and the first district to be operated on has been feued for building purposes. The principal feature of the scheme is the formation of a spacious street through the heart of the older part of the town.

**Mr. Henry Lord**, of Manchester, has prepared plans for proposed alterations and extensions to be made at the Salford and Pendleton Royal Hospital.

**Mr. W. S. Braithwaite**, of Leeds, has obtained (in a limited competition) the commission for the United Methodist Free Chapel in Headingley, which is to cost 3,600*l*. The same architect has been successful in the competition for St. Alban's Vicarage, Leeds.

**The Subscriptions** for the church of the Sacré-Cœur, Montmartre, have reached 15,000,000 frs., out of which 14,150,000 frs. have been expended on the works.

**The Derby Asylum Competition** has ended in the selection of the following plans:—1st, 100*l*., Mr. B. S. Jacobs, Bowl Alley Lane, Hull ("Lucidus ordo"); 2nd, 75*l*., Mr. Isaac Borrodale, F.R.I.B.A., St. George's Chambers, Grey Friars, Leicester ("Midland"); 3rd, 50*l*., Mr. Arthur Eaton, Commercial Bank Chambers, Derby ("Health and Convenience, with Economy").

**The Spire of All Saints Church**, Newcastle-on-Tyne, which was pronounced unsafe by Mr. R. J. Johnson, diocesan architect, after the storm of January last, has been restored at a cost of 1,050*l*., including some repairs to the roof, towards the payment of which only 500*l*. has yet been obtained.

**At the Parish Church of Woodnesborough**, near Sandwich, two ancient altars and piscinas have been found. They are supposed to have been closed up in the time of Cromwell. The church, which is being restored, is of Norman origin.

**Mr. Charles Trubshaw**, of Derby, has been appointed chief architect of the Midland Railway Company. He succeeds Mr. John H. Saunders, architect of the southern division, recently deceased.

**The Parish Church of St. George's-in-the-Fields, Glasgow**, was totally destroyed by fire on Sunday morning. The damage is estimated to be about 4,000*l*.

**The Paisley Liberal Club Committee** have decided to purchase two extensive sites on the north side of High Street for the erection of new club premises, to cost upwards of 10,000*l*.

**Mr. Jonas Proctor, C.E.**, for nearly twenty years borough surveyor at Bolton, has resigned his post, having accepted the chairmanship of a steamship company, Newcastle-on-Tyne.

**The Llanforda Tunnel**, the second in connection with the Liverpool Waterworks at Verniew, North Wales, has just been completed. The tunnel is 1,607 yards long—116 yards longer than the Cynion Tunnel—and the work of boring it has occupied about two years.

**Public Baths** are to be constructed at Rotherham, at an estimated cost of 3,500*l*., with site. The plans are to be furnished by the borough surveyor.

**The Local Guarantee Fund** for the recent Social Science Congress, at Birmingham, has shown a surplus of about 350*l*., which is to be divided equally between the Birmingham and Midland Institute, the Mason Science College, and the furnishing fund of the Jaffray Suburban Hospital.

**Mr. R. Barratt**, builder, of Leicester, met with his death on Tuesday. He was superintending the lifting of a heavy iron girder at the new gas offices of the Leicester Corporation, when the crane gave way, and the girder fell upon him.

**Messrs. Coghill & Co.** have claimed 14,000*l*. from the Cathcart District Railway Company as balance of contract amount, and for extra works. The case is being heard at Edinburgh before Mr. G. Cunningham, C.E.

**The Divisional Committee** for promoting the Manchester Ship Canal have made arrangements for raising the Parliamentary deposit of 285,000*l*. in January next, as required by the Standing Orders of Parliament.

**Messrs. Tangye** have had an oak casket prepared in Birmingham, which is to contain a copy of the first folio edition of Shakespeare, for presentation to the Public Library of Sydney. The casket is 22 inches long, 16 inches wide, and 15 inches high. It has been executed in Elizabethan style by Messrs. Marris & Norton.

**The Cells** of the Pontefract police-station on being examined this week, and the flooring taken up, brought to light that the foundation had subsided in some cases to the extent of 4 and 5 feet, the walls apparently having been left by the made ground beneath. The old Moot Hall is some hundreds of years of age.

**A Bill** will be introduced in the next session to authorise the erection of the Liverpool Cathedral. It will contain clauses providing for the acquisition of the parish church of St. John, for taking down the building and appropriating the site to the cathedral.

**The Expenditure** on churches at Middlesbrough during the past twenty-one years has amounted to 34,250*l*.

**A Stained Glass Window** has been executed by Messrs. Clayton & Bell for the chapel of the Royal Hants County Hospital, as a memorial of the late Sir William Heathcote.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, NOVEMBER 29, 1884.

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."*

**GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.**

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.  
"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.  
"Yours, &c.  
"JAMES WEIR, F.R.I.B.A.

"To Mr. Grundy."  
"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.  
"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."  
From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.  
"Mr. John Grundy."

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

**BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION** for coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh, and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use.

A horizontal boiler, 17 ft. 6 in. long, 15 H.P., gave the following results:—

Temperature on Plates .. .. .	186 deg.
"          Covering .. .. .	94 "

One ton of coal was saved per week, and, although the fire was raked out every evening 20 lbs. of steam were in the boiler next morning.

The following testimonial refers to this covering:—

Offices of Wimbledon Local Board, Wimbledon, Nov. 24th, 1883.  
Dear Sir.—It may interest you to know that we save exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

**BELL'S ASBESTOS PAINT**, for floors, stairs, and all interior woodwork, to prevent the spread of fire. This paint is especially useful in cotton mills, and in fact in all factories and buildings exposed to risk from fire. It is quite free from poisonous ingredients, and is both easily and cheaply applied. Bell's Asbestos Paint has, on several occasions, done great service in preventing the loss of life and property. The great fire in Buchanan Street, Glasgow, in November last, produced the following testimony to the value of this material:—

Offices of the *Glasgow Herald*, the *Weekly Herald*, and the *Evening Times*, Glasgow, Nov. 14th, 1883.  
Mr. John Bell,  
Sir.—As one of the means that helped to save our buildings extending from Buchanan Street to Mitchell Street from the recent great fire, I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the *Evening Times* case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of the Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood, thrice coated with Irish Lime, at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

**BELL'S ASBESTOS SASH-LINE CORD** is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire escapes.

TRADE

MARK.

## BELL'S ASBESTOS.

The goods of this house are of the highest quality only, and no attempt is made to compete with other Manufacturers by the supply of inferior materials at low prices. All orders must be sent direct to the undermentioned depots, and not through agents or factors.

**BELL'S ASBESTOS AND INDIA-RUBBER WOVEN TAPE AND SHEETING** for making every class of steam and water joint. It can be bent by hand to the form required, without puckering, and is especially useful in making joints of manhole and mudhole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 feet, from 1-in. to 3-in. wide, and any thickness from  $\frac{1}{8}$  in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears the trade mark, without which none is genuine. It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at my price, users are recommended to see that every 10-ft. length of the Asbestos Tape purchased by them bears the trade mark.

**BELL'S ASBESTOS CEMENT** for the backing of firebricks and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firebricks and kitchen ranges of private houses. Any labourer accustomed to handle other cements can apply this.

**BELL'S ASBESTOS BOILER PRESERVATIVE**.—This useful mixture, by absorbing the free oxygen that is in the water, entirely checks pitting and corrosion. It also disintegrates incrustation so immediately as to prevent its adhering to the plates. Not only is a great economy of fuel effected by keeping boilers clean, but the risk of having the plates burned is thereby obviated. It has been computed that 1-16th inch thick of incrustation causes a waste of 15 per cent. of coal;  $\frac{1}{8}$  inch thick, 60 per cent.; and  $\frac{1}{4}$  inch, 150 per cent. Thus the Preservative avoids the great risks which are inseparable from scaled plates, lengthens the life of a boiler, and covers its own cost a hundredfold by economy of fuel. It is entirely harmless, and has no injurious action on metals. It can be put into the feed tank or boiler, as may be most convenient. Sold in drums and casks bearing the trade mark, without which none is genuine.

**BELL'S PURE ASBESTOS CLOTH**, for protection against the spread of fire. Iron curtains warp, and in the great emergency of fire will often be immovable. Asbestos cloth, being incorruptible, will remain strong and flexible for an indefinite period, and will stay the progress of a fire and the passage of smoke longer than any other known material. This cloth is also extensively used in Maignen's unequalled water filters, for which a gold medal and diploma of honour were awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

**BELL'S ASBESTOS BLOCK GAS FIRES**.—The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas burner, is fixed at the bottom of the block. After being lighted a short time, both the block and asbestos fuel throw out intense heat.

**BELL'S ASBESTOS FUEL** for gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

**BELL'S SPECIAL LONDON-MADE ASBESTOS MILL-BOARD**, for dry steam joints, made of the best Asbestos fibre, is well-known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and  $\frac{1}{2}$  millimetre to 25 millimetres thick. Each sheet bears the Trade Mark.

# The Architect.

## THE DECORATION OF THE DOME OF ST. PAUL'S.—II.

THE second meeting of the Institute of Architects devoted to the subject of Mr. STANNUS's paper on the question what internal finish ought to be given to the dome of the metropolitan cathedral—and a truly vexed question it now seems to be—may be said to have done credit to the architectural profession in one sense, but not in another. The debate was lively. The divergence of opinion was wide and wholesome. Enthusiasm was abundantly manifested. Indeed, no little enterprise was displayed of a practical character. But at the end of the evening what could be said to be the result? Some will answer that the only result was entire confusion; and, no doubt, as regards anything like a verdict of the assembly, such would be the fact. But there was something much better than this, and in more ways than one.

Strangers ought to have been pleased to see how earnest the architects were in dealing with the problem as decorative artists, and also as iconologists. Perhaps it might have been better if they had sometimes attempted less in these directions—at any rate in one of them—and more in their own proper line of criticism. But we cannot help regarding the manifestation, nevertheless, as one of favourable import; for if the tendency of the age, as we have so often argued, has taken a strong turn towards the amplification of the architect's artistic authority and responsibility, there could scarcely be offered to the Institute a better subject upon which to encourage the members to exercise their judgment in a broad and comprehensive spirit. Professional decorative painters, it is clearly to be seen, are no longer to be left in independent charge of the great architectural problems of ornament in colour; however strictly the work may be mere superficiality, the more technical judgment of the trained constructor and historical student of articulated building is steadily coming to the front. Not only so, but the more sentimental, or, we may say, poetic prerogative of the architectesque picture-designer is also being assumed by the architect; and, although it is impossible to say that this attitude can be practically maintained beyond a certain limited extent, perhaps it is well, at any rate, within reasonable limits, that the habit of such exercise should be cultivated.

At the same time we may be excused for suggesting a regret that on Monday evening the more strictly professional ground of architectural criticism was so little occupied. Speakers—generally readers, in fact, of little papers, so carefully had they prepared themselves—appeared wholly to forget that the decoration of this dome is primarily an architectural question, and only secondarily a pictorial one; and, we may add, they still more neglected the fact that, except perhaps archæologically, and then only in a very subsidiary way, an architect's views of the hierarchy of heaven ought to be modestly and unofficially expressed. In a general way, the less he studies the Apocalypse the less will he make a fool of himself; and this the meeting had occasion to see.

Last week we discussed, briefly of course, the questions of decorating the dome by ribbed work, coffered work, columnar work (painted), and arched work; leaving to be considered, in the view we were taking of the subject, panel work and vault work. On Monday evening a great deal more was said of *zone work* than on the former occasion, and the contrast between this and rib work was made to turn chiefly upon the rival effects—strange as it may seem—of zones of figures and ribs of figures—the rib work of figures being the most characteristic feature of the now celebrated design left by the late ALFRED STEVENS, whose representative Mr. STANNUS, as his pupil and unswerving adherent, constitutes himself to be.

As the discussion progressed, however, it could not but become apparent how strongly a certain combination of rib work and panel work had, as matter of principle, if perhaps unconsciously, laid hold of the fancy of some of the best designers.

In St. Peter's at Rome (as we have already observed) the *motif* is properly rib work; but, inasmuch as the ribs are not much less than 10 feet wide at the base, corresponding with the width of a pair of coupled columns in the peristyle below, even this example may be regarded as one in which a series of double or coupled ribs serve as a framework for panel work of figure pictures on a very grand scale. In the case of the Invalides at Paris, on a much smaller scale, this principle is developed in a way still more pronounced, indeed, perhaps too much so. In several of the other examples exhibited amongst the illustrations on the walls, the same idea has been plainly accepted and acted upon. In Mr. PENROSE's design for the St. Paul's dome it is so. And in STEVENS's design itself, if properly regarded, it is equally so; for the great heroic figure ribs, which are therein built up with such prodigious force, are almost, if not quite, as wide as the coupled column ribs—for such they still may be called—of THORNHILL's extant picture work.

Now the application of this principle to the case of St. Paul's may be readily accounted for. A great deal was said by some of the speakers about the design of WREN being intended to close its verticality at the peristyle under the concave, whose simple unbroken entablature, they argued, must be regarded as a final feature of absolutely horizontal character, beyond which the unbroken hemisphere rises like the indeterminate vault of the sky. But such criticism overlooks one incident which must surely not be ignored. If the colonnade were as unbroken as the entablature certainly is, well and good; but no one can help seeing that, although the mere columnar arrangement is a perfectly simple disposition, with thirty-two equal intercolumniations, yet the eight blank interspaces convert this, by reason of the effect of the windows, into the very different arrangement of eight prominent triplets of light separated in the most emphatic manner by eight broad piers of wall, corresponding exactly with the octagonalisation of the crux beneath, and distinctly carrying up the octagonal plan from the very base of the architectural composition to its very summit. It is the recognition of this essential and fundamental motive that has prompted—perhaps as we have said, unconsciously—the adoption of the broad-rib principle of St. Peter's, and of the Invalides, by both Mr. PENROSE and STEVENS, by THORNHILL also, and, we may add, by BURGESS. The octagonal plan of WREN is, in fact, continued on principle by all of those artists, as if it were a matter of course, beyond the peristyle up into the vault; and there are many who will still consider themselves entitled to hold, not only that this must have been WREN's own intention (*quantum valeat*), but that it is the only correct basis of treatment, and the one that would certainly have been adopted by those whom Mr. CAVENDISH BENTINCK so affectionately calls "the old masters."

Mr. STANNUS presents to us the design of STEVENS upon this principle; and no doubt a truly heroic and most majestic scheme it is. Powerful Michel-Angelesque groups of herculean figures in the nude are piled one upon another in great pillars of awful life, unique and indescribable—except by the deprecatory term *acrobatic*, which is freely, although still respectfully, applied to them. Between these mighty ribs great circular medallions are occupied by other groups equally imposing. The *ensemble*, even if it could be duly appreciated from the gallery only instead of the floor, would unquestionably be most grand. But the detail is objected to; the whole affair is too palpably Pagan; and perhaps no more need be said. Mr. STANNUS therefore submits a modification of his own. The acrobatic ribs are abandoned; and the circular medallion picture-panels are left, with only such quasi-architectural features added as are requisite to fill up the composition; and this is the ultimate proposal for panel-decoration.

In opposition to this, *toto celo*, Mr. STATHAM, on what may be called philosophical radical grounds, led a good majority of speakers in the demand that the dome surface should be in one way or another treated as "the vault of heaven." Whether in white upon gold, in gold upon blue, in light colours upon dark, or in dark upon light, let the great unbroken expanse, they said, be filled with a heavenly host of some sort, in irregular whirls, in calm hierarchic zones, or in whatever other form of dim, apocalyptic vision, so that the spectator, gazing up from the distant terrestrial floor, may see heaven opened, and the infinite revealed to him in such suggestive form and ceremony as a painter's fancy of the noblest may be able to

portray. The critical principle here involved seems to be that the whole domical surface may be made a single quasi-realistic picture, architectural imitations wholly excluded, and subdivision, except by figure-grouping in indeterminate space, quite overruled. This is obviously the *ne plus ultra* of what we have classified as vault-work. No one would wish to deny the soundness of the principle; and even if criticism more especially architectural were to assert the artistic necessity, firstly, for *not* disguising the constructive form of the surface, and secondly, for conventionalising the figure-work so as to make it architecturalesque, yet still the doctrine of the single picture might none the less earnestly be defended, and its realisation imperatively demanded in some glorious work of the pencil, as a project worthy of our most advanced ideas of decorative skill.

The Institute meeting, as we have said, came to no vote upon the subject, but left the proposals as a whole in a state of confusion, which had been increasing during the whole course of the debate, and might have gone on increasing still if the controversy had not at the appointed hour run down. How the problem is to be eventually solved seems to be more doubtful than ever. There is so very much to be said on all sides, and apparently on any number of sides, and the British public are so little qualified to decide, that probably Mr. CAVENDISH BENTINCK is right after all when, as a somewhat Philistine member of the Decoration Committee, he told the meeting that, having with difficulty succeeded in defeating the portentous iconological project of BURGESS, the best thing they could do now would be to let the whole matter lie over *sine die*. One thing at least was wanting at the meeting—the presence of Mr. BERESFORD-HOPE.

#### WINTER EXHIBITIONS.—THE OIL INSTITUTE.

THE Institute of Painters in Oil Colours opened last week its second exhibition, and taxed the interest and the endurance of critics and picture fanciers with the inspection of nearly nine hundred canvases. On the whole the collection may be pronounced more satisfactory than last year, although some important exhibitors are absent or unfavourably present. The value of this alarming multitude of works lies really behind the foremost ranks, for the satisfaction to be derived from second-rate or mere market produce from the hands of men who are or will be within the Academy, or who have achieved a high distinctive position, is scant and pleasureless compared to the interest excited by the promise of young or original new-comers. On the whole one would rather not have to mark that the contributions of Mr. F. GOODALL, R.A., show a failure in his precise handling and luminous tone, or to say that the style of Mr. LINTON's single figures does not compensate for their lack of vitality, or that Mr. STOREY's art savours of the ceramic gallery, and that the less we see of Mr. MACWHIRTER in his present mood the better. And so on and so on: "the more's the pity," because this kind of thing need not be. There is, unfortunately, a tendency in the management of free and open exhibitions to grasp at the attraction lent by the presence of popular names in the catalogue, and men of repute are tempted to send in slight studies or mere pot-boilers to add supposed distinction to the walls at the cost of their own dignity. The onus lies partly on the gaping ignorance of the average public, but only in part. If artists would judge themselves and one another more severely in this matter, they could educate the public not a little.

The Institute publishes a catalogue with illustrations that serve as useful notes. Mr. LANGLEY prints a sketch of the old man in his powerful picture of *Cork Cutting*, a study in *chiaroscuro* strong, but without that mystic witchery which REMBRANDT drew from subjects no whit less homely. One of the cleverest figure subjects is not illustrated, *A Moor's Shop*, by SOLOMON SOLOMON, wherein the figure of the Oriental merchant squatted amid the multifarious artistic wares of his stall, is cunningly cast half into shadow half into light. Mr. SOLOMON has showed himself a student of luminous effect on somewhat eccentric lines within this gallery and at Burlington House. The present picture affects no singularity, but shows assured command of means and a keen observation of the laws of light. Mr. WATERHOUSE's *Byway in Ancient Rome* groups women in antique costumes of saffron and red robe and filleted hair within a shadowed Roman street, with a picturesqueness and force to draw comment were the artist other than himself; but it is an homage to the painter of *The*

*Oracle* in the last Academy to perceive in this picture a mere stopgap, and unwonted carelessness in sundry details of perspective and other truth.

The school of domestic sentiment finds plenty of apt exponents in the gallery. Mr. KILBURN is always pleasing within this limited range; and a new-comer, Mr. ARTHUR HACKER, makes a mark. The *genre* of history falls to Mr. STANILAND, and Mr. SEYMOUR LUCAS, who sends an effective incident in *The Elopement* of a cavalier gallant and lady of the "Restoration" type, now arresting flight for rest and food in a wayside inn, where the obsequious landlord seems to recognise in the befeathered and becloaked lover, CHARLES REX himself, or at least the braggart BUCKINGHAM. The extremes of interpretation of rustic life may be contrasted in the dainty affectations of Mr. CALDECOTT's miniature groups of last-century village life, savouring of CRABBE's *Tales of the Hall*, and the downright naturalism of Mr. CLAUSEN, who studies the coarsened face of *A Woman of the Fields*, and all the havoc that weather and privation and hard labour have worked there, in nature's red and white, with a literal copyism that becomes revolting in spite of the painter's mastery. To turn from such unflinching approach to common nature and contemplate the attempts of Mr. STOCK to embody pictorially the intangible subjects of poetic mysticism, or the essays of Mr. WALTER CRANE to portray, with an ingenious surrender of actual truth, his mediæval fancies, gives one the feeling of standing on one's head, so sudden is the transition. Mr. CRANE's *Belle Dame sans Merci* would work effectively into tapestry, especially if he would condescend to supply the knight with a body inside his armour, and set him in more manly guise upon his steed. The prettiest invention and most artistic work bestowed upon fanciful subjects is, to our thinking, found in Mr. JOHN SCOTT's *The Fairy's Messengers*, a charming faëry idyll, where amid the glinting green lights of a woodland nook the girlish elf, lying in long grass, issues her commands to a row of rabbits standing up on their haunches in various attitudes of attention. One of GRIMM's wonder-stories could not be more deliciously on the borders of the real-unreal.

Genteel comedy was always at home in the Water-colour Institute, out of which grew this association of oil-painters. The neatest hit is made by Mr. F. BARNARD in touching off an antique buck of the old school, with a nose like the Iron Duke's, ordering his dinner within a cosy pen at a chop-house, and disgusted to hear from the attendant Ganymede that "Ducklings and green peas is off." The matter is naught, but the manner inimitably racy. Among portrait heads, and there are many good studies, a bust length of a girl in a crimson hat and dress by JOHN PARKER, is admirable for colour and fresh broad handling; while a little sketch profile *Portrait* of a man in a slouching hat, little more than a rubbing in, has such *chic* about it, that we ask what next will the painter, C. K. MCCAUSLAND, do.

The amount of good landscape proper in the gallery is not much, while of landscape *genre* there abound evidences of thoughtful and artistic promise. The names of HENRY MOORE, and W. L. WYLLIE, and HAMILTON MACALUM, need no puff as sea-scaphists. We have, however, seen Mr. MOORE to better advantage than in this *Midsummer Sea*, which somehow looks less like ocean in an oily calm than some unknown chemical fluid working up into strange currents of motion. Mr. TOM LLOYD sends a capital crisp study of *Fisher Boys*, grouped in boats and over the clay-coloured rocks about a little creek, and Mr. NAPIER HENRY's *Hauling Crab Pots* is strong and brilliant. For quiet English landscape, with and without figures, we have noted new and known names: EDWIN BALE, LINNIE WATTS, Messrs. F. WALTON, J. PARSONS, R. MACBETH. In landscape *genre*—a moonlight effect—*The Trysting Place*, by W. H. HUMPHRIS, is noticeable. There are bright "impressions" of pastoral figures and landscape by Messrs. STOTT and CAFFIERI; also comment-worthy pictures from Italy by POWNALL WILLIAMS (abominably "skied"), M. R. CORBETT, and E. R. HUGHES; of which triad in manner the first is showy and radiant, the second delicate, luminous, and faithful, the third laborious, heavy, but faithful also in a curiously attained truth of line and relation of colour. Mr. E. BENSON would make a fourth in this group. Finally, let us award a line of recognition to flower painting in the hands of Mrs. CECIL LAWSON and Miss L. PARSONS, who have a right sense of arrangement in their groups of harmoniously-coloured blossom and leaf.

## OLD LONDON.\*

IF in a few words we had to describe the portfolio of etchings which Mr. ERNEST GEORGE has completed, we should say that the collection appears to be the record of a search after light and shade in London. Thanks to official regulations and other causes street architecture is characterised by flatness of surface, and it is almost a risk for an architect to introduce projections unless they are to be measured by inches. If he tries to evade the Metropolitan Building Act he is supposed to sacrifice his clients' interest, for as every inch of ground is valuable, the most prudent course is to bring the largest possible area under a roof. Hence it follows that buildings in which impressive effects of light and shade are apparent must become more rare in London. An artist who has a desire to feast his eyes with the delight of *chiaro oscuro* must seek for it in the byways. Before long it will not be found in those places, for the spirit of improvement has an aversion to shadows, or in other words to features which, producing shadows, are suggestive of individuality in the builders or the owners of houses.

It must, however, be admitted that there is no quality in an architectural work which is so little recognised by the public as that which results in the play of light and shade. Few people, it has been said, pay any attention to the transformation which is constantly going on in the cloud scenery that is visible everywhere, or have any knowledge of atmospheric effects. The Roman poet long ago remarked how the thousand colours which gild the day neutralise one another, and, to an ordinary spectator, Nature's palette appears rather limited. In the same way it needs a sort of education to enable the majority of people to recognise the importance of shadow, not only in adding beauty to forms, but in expressing them. This is true especially in architecture, and we may be certain that a great many of the so-called improvements would never have been carried out in old buildings, if the projectors could have foreseen how much was to be lost by the removal of things which created shadows. What, after all, is the picturesque but that quality in an object, no matter whether it is a mountain, a Mediaeval cathedral, or a shaggy goat, which affords opportunities for contrasting lights and shades? In our modern desire for uniformity we overlook these facts, and, in course of time, we become almost incredible of their existence. People have grown so familiar with monotony in London that to many of them the etchings of Mr. GEORGE will be a surprise, if not a revelation. Some may even say that the views are imaginative; and as the recognition of the picturesque needs something more than seeing with one's eyes, we should not be surprised to find it said that the etchings will not bear to be compared with the originals. The immortal PETER BELL spent his days and nights amidst the finest scenery in the kingdom; but he was proof against the witchery of nature, and to the end of his life the yellow primrose was to him the yellow primrose, and nothing more. In the same way, keen-eyed, matter-of-fact men might take a short cut every day through Probert's Place from Regent Street, or through Crown Court from Pall Mall, or drive through Wych Street to the Law Courts, without perceiving any of the effects which Mr. GEORGE has expressed. As COLERIDGE says, "We receive but what we give," and an artist's eye will always create something beautiful out of the most sordid scene.

The first etching shows the house of Sir PAUL PINDAR, which no longer exists, in Bishopsgate Street. The great projecting windows, with the middle parts far in advance of the sides, give Mr. GEORGE a good opportunity to show his skill. It has been often drawn and engraved, but this is the first plate that does justice to the window. In the next plate we have Wych Street, with a glimpse of the tower of St. Clement Danes. It is enough to drive a district surveyor to distraction to see such a variety of planes in the storeys of the houses, and a zealous officer must often wish that he could summon the builders of a past age for their want of foresight about the clauses of the Act of 1855. It is no wonder that several of the houses have been lately removed. The third view takes us to the Harbour Master, at Limehouse, one of those riverside public-houses that seem to have been made up from time to time of waifs and strays of timber, and of which as many rooms as possible are built over the Thames. No more characteristic

structures exist for an amphibious population, and the piles, posts, steps, hoarding, masts, flagstuffs, &c., have a fascination for painters. Then we have Foubert's Place, which becomes more strange from its contrast with the adjoining Regent Street. Here the view is taken so as to show the corner with the newsagent's and haircutter's shops. Everything has a tumble-down character, but somehow the buildings endure, and to a few passers-by they give as much pleasure as the stuccoed elegance which is near them. There are many Londoners who do not know either Foubert's Place or Crown Court. The latter leads from Pall Mall to King Street, and the entrance is opposite Marlborough House. It is not picturesque, and must have been difficult to treat. We did not think so much could be made of the place as is done by lighting the upper part of one side, and throwing the remainder into shadow.

There is higher architectural character about the subject of the sixth plate—St. Giles, Cripplegate. But Mr. GEORGE appears to have been more attracted by the houses which almost enclose the church, and has introduced the overhanging windows very effectively. In spite of all the trade which is seated thereabouts, Cripplegate is one of the quietest parts of the City, and is the more interesting as some of the work represents the time before the Great Fire. This plate is followed by another bit from the City—a corner of St. Bartholomew's, Smithfield, and, if we remember rightly, one of the houses shown encroaches on the church itself. A second river scene is derived from the timbers of Battersea Bridge. The sketch was taken when the tide was very high, and shows one of the cutwaters in the foreground, on which the light falls, leaving the superstructure of the bridge in shadow. St. John's Gate, which we next meet, is a sparkling etching. The fine old gate is well contrasted with a shored-up house and other frail tenements. Then comes another bit from the river, the subject being some of the stores between the Houses of Parliament and Horseferry Road.

A few houses are given from that part of the busy Aldgate where the butchers most do congregate. The manner in which Mr. GEORGE regards London will be derived from his description:—"The etching," he writes, "shows a group of butchers' shops that stretch out into the wide street; behind them are the shambles, and in the dim recesses beneath the old houses there is the charm of shadow, colour, mystery, and movement. The high boots and blouses give a distinctive character to the men of this unsavoury quarter. A continuation of Aldgate is the Mile End Road, a broad thoroughfare much given over to taverns, one interesting specimen being placed really in the middle of the road, and dividing the traffic; benches and tables are generally set out on the wide pavement, and at night, with the flaring lamps, groups remind one of Ostade and Teniers."

A view of Temple Bar, which was taken in 1877, with St. Dunstan's tower and Fleet Street beyond, is a good memorial of that structure. Another record of a demolition is the etching of the Oxford Arms in Warwick Lane, in which we have one of those houses that so well suit Mr. GEORGE's style. Different in character is the bit from the Tower of London, which has been sketched from the river. The boats, trees, steps, walls, the middle tower, and the "wooden shanties which have grown about the severe stone walls to increase the comfort of the warder," form a pleasing scene that is anything but suggestive of the grim fortification. The Old George public-house on Tower Hill is a fit accompaniment to the Tower scene, and after it comes another river-side public-house and sheds. London Bridge is hardly the subject that one would expect Mr. GEORGE to undertake. He has treated it in an original manner, the view being taken from the landing-stage on the Surrey side. The projecting buttresses and cutwaters are emphasised, and lead to the offices on the Middlesex side, with St. Magnus Church and the Monument.

Mr. GEORGE then turns westward, and gives a view of Staples Inn, which, in spite of some modern features, retains its attractiveness. Oxford Market, sketched in 1880, with its Tuscan columns and high roof, was an interesting example of eighteenth-century work, but it was not a profitable enterprise, and has been removed. Lastly comes what is probably the best bit in Drury Lane, that is, the old houses at the south end, with Drury Court and the church of St. Mary-le-Strand.

Throughout the twenty etchings which form the series, we have excellent work. As we have said at starting, Mr. GEORGE appears to be more eager to express effects of light and shade

\* *Etchings of Old London.* By Ernest George. With Descriptive Letter-press by the Author. Published by the Fine Art Society.

than details. He endeavours to suggest the mass of a building without loitering over any one part. Apparently, the etchings have been executed in the simplest manner, that is by bold strokes, which generally run in one way, and with as little outline as possible. But if a student tries to copy a plate in pen-and-ink, he will find that those simple lines mean more than he supposed, and that they must be the result of a masterly hand, directed by a clear idea of what is to be represented. Apart from their beauty, the etchings as studies of light and shade will be found invaluable. There is none of that patchiness which is sometimes seen in black and white. The shadows of the parts all coalesce in a whole, and both unity and repose are secured. It is a mystery how so great a quantity of work of this class can be produced in the leisure that is at the disposal of a busy architect. But as Mr. GEORGE apparently has an inexhaustible amount of time, we hope that he will give us many more plates of what may remain of Old London. The etchings are dedicated by Mr. GEORGE to Mr. PERO, his partner, as "One who is in hearty sympathy with the old world, a lover of Old London, and who shares with the author the pleasures and responsibilities of slightly influencing the London of the future."

#### AWARDS TO VENTILATORS.

THE disappointment that has arisen in connection with the latest attempt to prove the relative value of ventilating cowls, by means of so-called scientific tests, is an illustration of the correctness of the opinions expressed by us in the article on "Cowl Testing," which appeared in *The Architect* of the 1st ultimo.

It would appear from the description given of the *modus operandi*, by those who witnessed the proceedings, that the arrangements were of such a nature as to be almost incredible. It is not our object here to describe or criticise these arrangements, as this has been already fully done through our correspondence columns. What we wish to draw attention to is the great injury which is likely to be inflicted on the cause of sanitary science by proceedings of the character of those in question, as they undoubtedly do more to nullify the endeavours which are being made to force the importance of ventilation on the public, than anything else that could well be imagined. To secure public confidence it is necessary that personages assuming the position of teachers, or instructors, should show that they are qualified and competent to fulfil the duties of their office. They must next demonstrate, by their treatment of the matter entrusted to them, that they fully grasp the nature of it, and that their mode of dealing with it is the correct one, and in accordance with the rules which govern it. They must also show, by the result of their labours, that they have really achieved what they have been striving after, and prove the correctness and value of those results to the satisfaction of an intelligent community. All these are essential before a favourable impression can be made, or that confidence inspired which facilitates the adoption of any reform.

Now let us see how this applies to the bodies who have taken upon themselves to be authorities, judges, teachers, or whatever they may choose to call themselves, in the great cause of sanitary reform. We are forced to confess that the retrospect is by no means encouraging; indeed, it is so much the reverse as to be absolutely disheartening.

Let us take the proceedings of the Sanitary Institute of Great Britain as an instance. The Institution was formed a few years ago by a number of sanitary engineers and doctors, for the purpose evidently of affording them an opportunity of declaiming at large on the special merits and virtues of their own particular schemes and nostrums, and the general advancement of their own hobbies. One of the best known acts of this body is what is now termed the "Kew farce," the details of which are too familiar to require repeating here. We have, however, only got to do with showing the injury which is inflicted on sanitary science by all such proceedings.

The first effect of the publication of the results of these experiments was an immediate and considerable falling-off in the sale of ventilating appliances. We have certain information on this head. If this lack of demand for, and disbelief in, ventilating appliances had continued for any length of time, which fortunately it did not, an incalculable amount of mischief would

have resulted, by discouraging and driving out of the field the large number of practical men who had devoted their time and talent to devising improved forms of ventilation, and bringing them before the public. It would also have nipped in the bud any new ideas which might have been developing, and have stopped inventors from continuing their labours in this direction, when it was evident that there would be no demand for their productions. In the second place, sanitary science, so far at least as ventilation was concerned, would have been checked and brought to a standstill. We should have been practically in the position of our ancestors, for whom a simple opening through the roof was all that was provided for ventilation. Yet this is the device which the Kew experts have recommended as being greatly superior to any scientific arrangement that could be employed. Such a misunderstanding of the subject could not be surpassed. It showed that the experimentalists were unaware of the efforts which had been made by scientists during the past and present centuries to devise effective means of ventilation, and the results of whose labours and experiments have always been before the public in the form of scores of books. Now if a simple open pipe had been found to really answer the purpose, what was the use of all the labour and talent which had been expended in the production of improved ventilators?

However, this is a point we need not discuss here. Every one is aware of the true value of an open pipe when employed for purposes of ventilation, and we merely draw attention to it to show the inexperience that may exist amongst men who profess to be qualified authorities.

The *Times* took the matter up and exposed the absurdity of the results, reading a severe lesson to the Sanitary Institute. Other journals followed, and the worthlessness of the tests were so conclusively shown that public confidence in ventilating appliances was gradually restored, but the cause of sanitary science received a blow from which it has not yet recovered.

It is understood that the Sanitary Institute is again, after a lapse of fully six years, conducting experiments; but it is to be feared that, when they are completed and the results made public, they will only go to increase the injury which has been done by the first attempt. But whatever may be the result, it cannot be more injurious than the "testing" at the late Health Exhibition, which has already become a subject for derision.

It is beyond comprehension to find so much time and money expended in order to show that of a few articles experimented upon one is found to answer better within a room than the other. As we have already endeavoured to explain, all cowls do not act alike in certain situations or in certain seasons of the year. Because the situation and season in which the cowls are tested happens to suit one better than its rivals, that cowl should not be proclaimed to the world as the best until it has been tried under different circumstances. This suitability to one set of conditions is a common experience. Mr. G. W. Webb, architect, whose letter appeared among the correspondence on November 15, expresses the view very fairly. "It is well known," he writes, "that many ventilators will not act properly when exposed to an open air test such as I have suggested; fog, rain, and dense atmosphere being so prevalent in this country; that unless a ventilator will act during all atmospheric changes of the weather, it is practically useless, and I fully expected that a most exhaustive trial would have taken place to thoroughly test the respective merits of the various ventilators exhibited."

Unless the tests were of a kind that could not be impugned, it is unwise for a jury to interfere with the business of any class of manufacturers. Trade has a marvellous way of adjusting itself. The best ventilator will readily demonstrate its superiority without extraneous aid. The public are sufficiently alive to their own interests to know when a thing suits them, and answers its purpose, and when it does not. The best cowl will have the largest sale, and the worst the smallest. It may be relied upon that the cowl for which there is the largest demand, and which has been shown to be successful under the most trying and varied conditions, will be found to be the best cowl.

If such experiments as those under review were to be accepted as conclusive, an unprofitable cowl knocked together by some tin-smith might happen to suit the peculiar conditions of Moreton Gardens, and be declared the victor over the heads of cowls that had been years before the public, thoroughly tested and proved to be good, and in favour of which the highest testimony was fur-

nished. It would be absurd to suppose that such an experiment is to be accepted as nullifying all the successes which may have been achieved by the other cowl in actual practice.

It is an instructive lesson to compare the different tables of results published by experimentalists. It will be found that, as a correspondent said last week, in no two cases do they agree, one table showing the ventilator as acting entirely contrary to what is recorded in another table. The important question therefore arises—How do the Sanitary Institute propose to prove that the table of results they may publish is the only correct one, and that all the others, including those of the Kew and the Health Exhibition tests, are wrong?

A good deal has been said about awards to ventilators and how they should be granted. There is no difference between a ventilator and any other piece of machinery or article shown at an exhibition. Then, why should it be judged differently? We suppose juries give their awards because they are satisfied from what they see that the article is a meritorious one, on the evidence that is submitted to them in proof of its efficiency. This is the usual mode of proceeding at all important exhibitions; and why should an award given under these circumstances to a ventilator not be as fair as in the case of other articles, if the exhibitor can satisfy the jury that the arrangement of his cowl is superior to others, and can prove by the strongest testimony that it is more extensively and successfully used than others?

Right nowadays in this country at last triumphs over might, and time tests all things, and it may safely be accepted as correct that the ventilator which constantly proves itself to be efficient wherever used, and which successfully stands the test of time, is certain to be a good and reliable one, and all the experiments in the world, whether showing in favour of or against it, would not alter its action or make it better or worse.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE third ordinary meeting of the Institute was held on Monday evening, Mr. Ewan Christian, president, in the chair.

The PRESIDENT said it was the intention of the Council on February 2 to nominate a gentleman to receive the Royal Gold Medal, and that any members desirous of making any suggestion should write to the secretary on or before the last day of the month. Letters were then read from Mr. Woodthorpe and Mr. Crace expressing regret at their inability to attend that evening. Mr. Crace wrote that in his opinion the internal decoration should be strictly in accord with the dignity of the building, and the keynote of his arrangement would be simplicity. He agreed with Mr. Armitage that it should be a grand design, clearly defined, and almost flat, with slight shadows.

The discussion on "The Internal Treatment of Cupolas in General, and that of St. Paul's in Particular," adjourned from the last meeting, was resumed. The members who took part in the discussion having for the most part committed their remarks to paper, read them to the meeting from their manuscripts.

### The Internal Treatment of Cupolas.

Mr. G. AITCHISON opened the discussion. As regarded the decoration, nothing, he said, would be more disastrous than postponing the work. Our public buildings were crying in vain for completion by sculpture and painting, and if the work were now indefinitely postponed until the best of all possible designs could be got, a blow would be given to decoration from which it might never recover. Who could say that we might not become involved in a great war?—and the adornment of our great public buildings might be postponed for a century, and possibly for ever. Whatever might be said of the late Alfred Stevens's design, it was undoubtedly the design of a man of genius. Owing to objections on the part of the Committee to certain portions of this design, Mr. Poynter was asked to make certain modifications of it, and this modified design was now to be seen *in situ*. Sir Frederick Leighton, as a tribute to the memory of Stevens, undertook to make the cartoons for the large circles, at a cost that would involve him in heavy pecuniary loss for a series of years. When the country had been enabled to secure the services of such eminent men for a nominal sum it did appear to be the very height of madness to reject the offer, for it should be clearly understood that this almost gratuitous tribute to Stevens's memory could not be had if some other design than that of Stevens were substituted. Some wiseacre suggested that our public buildings should not be decorated till we could secure the services of an English Titian, which reminded one of the Greek who swore that he would never go into the water till he had learned to swim. The triumphs of Titian, Tintoretto, Paul Veronese, Correggio, Raphael, and Michael Angelo were due to the antecedent century when decoration was applied to every public building, and by this means a school was

formed from which these transcendent geniuses were evolved, and we should be putting a stop to further excellence in mural decoration if we rejected the work of the greatest extinct genius this century had produced in England, carried out as it would be by two of the ablest painters of the day. Mr. Aitchison said he might add that if Stevens's design was to be rejected and a fresh design made, in common courtesy Mr. Poynter and Sir Frederick Leighton should first be asked to give their own views of what would be appropriate, and the committee must be prepared to pay the current price for the design and the subsequent cartoons.

Mr. FRAMPTON thought a simple grid treatment, in relief, with panels—if any, egg-shaped panels—and with fresco decoration, would not be objectionable; but he favoured representing the dome as an aerial vault in imitation of the grand azure vault of the heavens, having as its basis a blue background with white figures. Figures he would not set between vertical ribs or between horizontal zones. A gold background, with or without figures, would not be effective. The gold treatment would be out of place in the cathedral, though the use of gold was very suitable to give effect in secular buildings.

Mr. EMERSON said he agreed with Mr. Aitchison, who expressed his dislike for postponing the work. Mr. Stannus had laid down a rule that the decoration should articulate with the subjacent architecture, and yet from what he said later on in regard of the ribs, Mr. Stannus did not seem to hold the rule in favour, but to be arguing for Stevens's design, or rather his modification of that design, against his conviction. Mr. Emerson expressed himself in favour of zonal treatment, after pointing out that only three or four examples could be adduced as precedent for Mr. Stannus's rule out of twenty-six domes of importance that were decorated interiorly.

Mr. ARMITAGE said that as a painter he much preferred the new design to those cut up either by vertical ribs or circular panels. In Wilde's design the painter had fair play. Groups and figures, whether good or bad, would be seen, and not smothered as Mr. Poynter's was by very questionable architectural details. As to Mr. Poynter and Sir F. Leighton, his only regret was that such good work was, owing to the circumstances, so thrown away. If fair play had been given to Mr. Poynter—that was, spaces of ample size, semicircles that would cover a quarter of the dome—his beautiful drawing, colour, and other excellencies would have been appreciated. He not only objected that it was not properly seen, but that it was distorted. Michael Angelo he admired as a draughtsman of immense power, but the cramped figures of the Sistine Chapel struck him as a display of barbaric power. The distorted figures of Michael Angelo were totally out of place in the dome of a Christian temple, where ample space must be allowed the painter to freely develop his groups; otherwise, to accommodate himself to the space at his disposal, he must adopt acrobatic positions for his figures. It might occur that at times the dome would be brilliantly lighted—as by electricity; but even then boldly treated groups and masses would look better than any rib arrangement. Painted architecture killed figure-work, and in spite of Michael Angelo's authority, there seemed a want of reverence in making angels and saints do duty as caryatides to carry up architectural features in the dome.

Mr. RALPH NEVILL said he thought the discussion was hardly intended to turn on picking holes or making comparisons on different persons' designs, but it was open to discuss the main principles of the decoration. He asked whether gold mosaic or the figure subjects upon it was to be regarded as the most valuable, and ventured to say that the gold was the important part of the work, figures and colours to be used rather as a framework for the gold mosaic. In St. Paul's neither figures nor colour would ever show much. Even gold mosaic would show but little except where the light fell on it. Early examples showed that colour was used very sparingly on the gold. White was used, and more than half of the colour put on was white. The early painters, Orcagna and Giotto among them, used, and only used, small quantities of colour to accentuate the white. The rib treatment he considered a false mode of cutting up a dome. They were never found in Byzantine work, and domes belonged to the Byzantine style. The only reason ribs, &c., were introduced was, he believed, because it was rather a serious matter for a painter to make a design for the whole, when they could escape that trouble by splitting up their dome by ribs and circles. He was pleased to hear previous speakers connect the idea of the dome being suggestive, and made expressive of the vault of heaven. Our idea of a fine day was a blue sky, with a white cloud or two. We did not imagine many clouds of various colours. Mr. Nevill also remarked that any zonal treatment should run round the bottom of the dome, the upper part being left free.

Mr. WOODWARD said that the cartoons in St. Paul's might be carried out without further notice, and the cathedral spoiled before they knew anything about it. He condemned what he had seen there as utterly destructive of scale, and as bringing down the concavity of the dome. Mr. Stannus's scheme was, he thought, the more defective design, being work common to every decorator's shop and school of art in the country. [While Mr. Woodward was speaking, Mr. Stannus, followed by Mr. Penrose, rose to protest.] Mr. Woodward said that the designs had certainly been put in the

cathedral to be criticised. The proper treatment, he thought, would be to cover Sir James Thornhill's work with several coats of paint, and then distemper it. This would enable them thoroughly to realise the beauty of the dome.

Mr. G. A. AUDSLEY said that an improper treatment of St. Paul's would be little short of a national calamity, and he protested against any scheme that involved ribs, panels, or vertical forms of whatever kind. He agreed with Mr. Statham's remarks made at the previous meeting, and considered they had nothing further to do with verticality above the cornice line of the peristyle. Existing examples of the vertical treatment tended only to satisfy him that, from every point of view, to adopt it at St. Paul's would be a grave mistake. Where it had been used he thought its use had always been more or less originally contemplated by the architect. Here they had the vertical broken by Wren with the unbroken horizontal line of the entablature. The vertical was completed, the horizontal defined, and a zonal treatment should crown the whole with appropriate mystery. Mr. Audsley disapproved of the eightfold division of the dome and introduction of colossal figures, and compared the effect to that of a carpet pattern badly designed in large squares. The visitor's eye was caught at once, and after he had counted the squares in the pattern the carpet had no further interest for him. Mr. Audsley then stated what he considered would be the proper treatment, as follows:—1. That the internal surface of the dome, circular in plan, must not have a vertical, divided treatment. 2. That the surface of the circular dome, being uniform and unbroken, must not have any decoration calculated to interfere with it. 3. That if the surface of a circular dome must be divided by decoration applied to it, that division must be zonal in character. 4. That the zonal treatment must not be of so pronounced a character as to call special attention to the lines of the division. 5. That the subject of the decoration must admit of the introduction of a great number of details of moderate size, so that the dome may be increased in appearance to the eye of the observer. 6. That the subject must form one grand composition, rather than be disconnected and isolated in its constituent parts. 7. That the subject must be one which, transferred to the domical surface, will not strain the eye of the observer nor strike him with absurdity. And lastly, that the subject should be one in which a certain mysterious and supernatural character prevails, and which should call forth the highest powers of the imagination. Mr. Audsley, in regard of the subject matter for the decoration, said it might be the glory of heaven immediately following the last judgment, the Judge having descended with His hosts of angels, earth having given up her dead, the good and bad parted—the latter hurled into the bottomless pit, the just gathered together by the angels having followed their Saviour into heaven. Christ depicted on the throne of heaven, the choir of seraphim in the first zone nearest the crowning, and the various other angelic hierarchies in the different zones, below which the blessed, and the lowest zone of all would be the link between heaven and earth. This would provide ample scope for the artist, and give him a large field for the display of the finest colouring.

Mr. BLAGROVE agreed with the opinion that dividing the dome up would detract from its size. Coffered treatment, he suggested, would be the most proper, as the vertical lines or ribs advocated by Mr. Crace would be obtained, and the horizontal lines recommended by Mr. Seddon would be preserved. He did not mean plaster or pictorial coffers, but a flat-coloured decoration by which the architecture would be emphasised.

Mr. J. D. MATHEWS recommended that the dome should be dealt with as a vault, and suggested it should be cut into three horizontal divisions, to represent earth, sky, and heaven.

Mr. W. WHITE spoke of blue as effective in producing distance: gold or yellow brought the distance near to the observer. It was not a question of sentiment, but one entirely of fact, and for many reasons it was true that the dome should have blue for a background; but, considering how dark the dome was, blue unless very pale would become black. What would give distance would also give dimension, and, while colossal figures would be entirely out of place, it would be impossible to put merely life-sized figures if they were to have any effect whatever. The figures would be somewhat larger than life, the gradation in size to range in accordance with the height.

Mr. DAWSON thought there was an illusion in trying to picture to themselves the dome as the vault of heaven. How could the peristyle of St. Paul's support the vault of heaven? He did not think the cathedral would be benefited by putting an immeasurable vault on it, but they should rather put one which would be suggestive of a dome of the same diameter as the peristyle, without putting anything to bring it down or detract from its scale. There should be no vertical lines, but they might have a free treatment in zones.

The Hon. CAVENDISH BENTINCK, alluding to the fact of his being the only member of the St. Paul's Committee present at the meeting, said he was asked some years ago by Sir William Tite, then advanced in years, to become a member of the Committee, and assist him in his labours on that Committee, and be his representative. He (Mr. Bentinck) was one of four out of the Committee who prevented the destruction of St. Paul's by Burges. Mr.

Bentinck said he had a great respect for the old masters, and valued work according as it approached or receded from the standard of the old masters. He had a great admiration for Wren, and thought they should do the best they could to preserve the work of the genius they all so much admired. No one, moreover, had a greater admiration for Stevens than he had. He had assisted Stevens to the utmost of his power in regard of the monument of the Duke of Wellington. For years he had fought his battles, and when others derided Stevens he had always had confidence in him, and maintained that his country would have reason to be proud of him. With all his respect for Stevens, he did not approve of his design for the dome of St. Paul's. It receded from his ideas of the old masters' works, because it would break up the dome too much and give it a fragmentary appearance. His opinion was that the dome should have a broad and free treatment. The church of the Madalena, at Venice, was a good example of a coffered dome, but he would not recommend that treatment for St. Paul's. He was in favour of pictorial treatment on a large, grand, and striking scale—the pictures to be plainly visible from the pavement below. It was far from his intention to depreciate the works either of Mr. Poynter or Sir F. Leighton, but he imagined most of them would think it undesirable to proceed further in that direction. None of the designs hitherto made appeared to him satisfactory, and he thought they should pause before destroying Thornhill's work. He would advise them, in fact, to wait for some time, and leave St. Paul's alone until some great artist or master mind should arise.

Mr. BRYDEN expressed himself in the main in favour of Stevens's design, but objected to features in the later design and Mr. Stannus's designs. The circles were a mistake, and Mr. Stannus had owned to the introduction of ribs to counteract their restlessness, and the ribs contracted the dome in apparent size. He suggested the retention of Thornhill's subjects, but that their architectural accessories should be replaced by better work. The dome should not be regarded as the vault of heaven, but should be treated as a hemispherical surface. If they were to deal with some of the smaller vaulted surfaces in St. Paul's before attempting the decoration of the cupola, they would gain experience and skill for solving the more difficult problem of the dome.

Mr. J. P. SEDDON said that he thought Mr. Stannus was to be congratulated that one at least of the many who differed from him as to the principles for the decoration of the dome of St. Paul's, had had the temerity "to write a book"—that is to say, to put on paper some realisation of his idea. The time since last meeting had been short for the purpose, but Messrs. Belham had kindly permitted their artist, Mr. H. Murray, whom he (Mr. Seddon) could claim as having been his pupil as to decorative art, to work out a scheme from his sketches and directions on the basis of the picture by Sandro Botticelli that he had referred to. Such as the drawing was, he left it, with deference for criticism, aware that it must be abundantly open to such. Nevertheless, he maintained that he felt confident that the principles upon which it was founded were the correct ones.

Mr. STANNUS said that most of the speakers had answered one another, and so had simplified his task in replying. The zonal treatment he had tried and abandoned, because it cut up the dome into a series of measurable littlenesses, and also appeared in perspective as a succession of little steps. The treatment was one suited for a semi-dome seen only from one aspect. He did not know where Mr. Audsley would find room in the dome to represent the saints and the numerous angelic hierarchies in successive tiers. Mr. Emerson had referred to a number of Oriental domes, but St. Paul's was an Occidental dome, and must be treated accordingly. He would recommend those who objected to the use of gold to study its effect in the church of St. Mark's at Venice. Alfred Stevens's design was, he considered, the most original and the best design yet brought forward.

## THE GAMBETTA MEMORIAL COMPETITION.

THE following is a translation of an article by M. Albert Wolff in the *Figaro*, which, as coming from so distinguished a critic, has secured much attention in Paris. It is an outspoken reproof of the fussiness which has been introduced into French sculpture in order to gratify politicians:—

The question of the monument to Gambetta presents two aspects. If I were asked which I prefer among the five premiated designs that have been exhibited in the Palais des Beaux-Arts, I should reply, without hesitation, "Not one;" but if I were asked whether the model of M. Aubé, sculptor, and M. Boileau fils, architects, has merited the first prize, I should also reply that the jury were right, because it is evidently the most interesting work. The misfortune in this affair is that we are ignorant of the way to do anything with measure and tact. On all sides one turns with an equal facility into exaggeration. Not more to-day than on the day of his funeral have I a wish to diminish the fame of Gambetta, whom I loved much. But if the former Dictator could behold the memorial of himself which has been designed and selected, I am sure that with his fine sense of the fitness of things, he would conclude that

the zeal of his friends had gone beyond discretion. The successful design is not so much a monument as a secular cathedral, a work of the most complicated and obtrusive character. If Gambetta had governed the Republic for twenty-five years, if in his reign and through him France had become greater than ever, if industry and commerce had attained by his efforts a common apotheosis, if, through his influence, arts and literature had been restored to the glory of 1830, if he had endowed the country with imperishable institutions, put everything in its proper place, and inaugurated definitely the reign of justice—if Gambetta had accumulated all the civil and military glories, such a monument would still surpass everything that one has seen among the people who wish to consecrate the memory of their benefactor in a public place.

Monumental sculpture is especially difficult, because it presents itself to our vision in a large space. Its principal duty is, therefore, to strike the eye by clear, definite forms, to retain us by contours simple yet powerful. At the first glance one should be able to measure the work, and to feel its force. The great defect of all the models exhibited at the Beaux-Arts is the want of unity in the conception. Not one presents itself clearly at first sight, all suffer alike from an accumulation of incidents in the life of Gambetta, or of allegories of his virtues. These trouble the spectator, and attract his attention at the same time to the top, the bottom, the front, and the back of the monument.

The six models of an apotheosis correspond in defects of conception. They alike bear witness to the lamentable tendency of modern sculpture to become, as it were, literary sculpture. Our sculptors are not content to make a figure of Gambetta. They also desire to give his biography. Behind him, at his feet, at the four angles, upon the summit, they relate anecdotes, and in such a way that Gambetta himself is overwhelmed by the accessories. Monumental sculpture destined for public places should, above all things, be simple; it should impress us by the grandeur of the lines, expressing clearly the statue in space. In no past era have the sculptors worked otherwise, because throughout the centuries their art rested on the same principle of simplicity. Here where it is wanting there is no longer a work of art worthy of the name, for not one of the monuments exhibited in the Palais des Beaux-Arts is in a condition to satisfy connoisseurs. All are so complicated in the invention that the eye runs from one part of a subject to another without finding complete satisfaction.

I wish to aid the friends of Gambetta, and therefore propose an example in the monument that Italy has erected to Cavour in Milan. It is impossible to produce a more grand effect with simpler means. There is nothing of the inquietude of the models exhibited in the Beaux-Arts. We have simply a Cavour. His life is epitomised in a figure of History, who with a burin records the name of the great statesman on her tablets. The artist has expressed himself in such a way that posterity will conserve the renown of Cavour, whose genius has created an Italy that is respected, strong and united. The impression is the more striking as the idea is so clearly expressed. The artist has not spoiled his work by the abuse of insignificant and useless details, such as Political Wisdom and Military Force, personified under allegorical figures of a diplomat or a *bersagliere* of Palestro. The incidents of the life of a great man could be represented only in bas-reliefs on the pedestal, which should never compete with the principal figure. Let any one look at the six models, and it will be admitted that they resemble the apotheosis in a spectacle or *flerie*, at the moment when the principal personage, surrounded by allegorical figures, ascends in a cloud.

The best design among them is that of M. Aubé and M. Boileau fils. The proportions of the architecture are elegant, and the sculpture very interesting. M. Aubé has exhibited at the last Salon a statue of Bailly, the astronomer and President of the National Assembly, which is destined for the Chamber of Deputies. He is only forty years old, which, in an art so difficult, is hardly the maturity of talent. His first notable reward is dated 1874, when he carried off a medal of the second class. M. Aubé is not a Chevalier of the Legion of Honour, and what pleases me still more, he is not a Prix de Rome. I do not say that for a sculptor it is useless to make a pilgrimage to Rome, but it is not altogether necessary to be immured for three years in the Villa Medici in order to have some talent and to develop it freely. The monument has the form of a pyramid elevated on a *socle*. Gambetta is shown in an impressive attitude. Behind him is a figure of *War*, which has been evidently inspired by the "Marseillaise" that Rude has sculptured on the Arc de Triomphe. Gambetta is surrounded with warriors who brandish their swords or collect those that have fallen from hands that are rigid in death. At the base the *socle* is flanked with colossal groups. On one side is *Force*, and on the other *Truth*. These figures are not enough. Upon the summit of the pyramid the sculptor has hoisted an allegorical figure of the *Revolution*. She is seated on a lion, holding in one hand the Rights of Man, and brandishing in the other the thunderbolt of Jupiter. M. Boileau shows a remarkable water-colour which suggests what this spectacular apotheosis will be like when complete. The two allegorical figures as well as the *Revolution* on the summit are to be in bronze, the remainder in marble. It will assuredly be a costly monument, but it will never be a beautiful monument in the sculptural sense.

To be just, however, we must say that the moment was hardly well chosen to begin this apotheosis. I do not wish to introduce politics in a simple question of art, or to inquire whether Gambetta merited so obtrusive a memorial. In my opinion, a simple figure of the tribune would have sufficed. It is possible that in course of time Gambetta might have attained one of the first places among the statesmen of the age, but he died so young that he had not the opportunity to take the exalted position that the sculptors have imagined. The moment was unwisely selected, because the death of Gambetta is still too recent; the models revive the emotions excited by the funeral, and our sculptors seem to have laboured for the friends of Gambetta rather than for futurity. I maintain that not one of those who have lived in intimacy with Gambetta at the moment of his triumph is more anxious to preserve a memorial of him than I am, who was his friend in his obscure beginning. What thwarts me in this extraordinary apotheosis is not the homage rendered to a spirit grandly endowed, but the disproportion between the life of the tribune and this monument, the like of which has not been seen in a former age.

It is remarkable that all the competitors fall into the same vagaries. M. Falguière has imagined a Gambetta as a tribune, which was perhaps the true idea to express in the memorial. A head of the orator, which the sculptor has placed at the side of his small model, is remarkable. But M. Falguière has, like others, spoiled his design by allegorical figures which represent *Patriotism*, *Eloquence*, and *Wisdom*, and struggle like maniacs about the pedestal. The project of MM. Coutan and Lambert resembles an epergne. M. Coutan was represented in the last Salon by two remarkable busts; he won the Prix de Rome in 1872, and four years afterwards was awarded the Première Médaille of the Salon.

The colossal *Atlas* exhibited by M. Injalbert in 1876 may be remembered. He also gained a Prix de Rome, and a first-class medal at the Universal Exhibition of 1878. In partnership with M. Laloux, the architect, he has invented a complicated apotheosis in which Gambetta has the appearance of a singer in an opera. Then there is the design of MM. Allar and Dutert. The sculptor is a distinguished man—a Prix de Rome, the recipient of many rewards, and his *Death of Alcestes* obtained the Médaille d'Honneur in 1878. His design is suggestive of a fountain. At the feet of Gambetta we see little soldiers defiling, which recalls one of Duprè's pictures, but the figures are without sculptural character.

A word must be said about the model by MM. Dalou and Faure-Dufarrier. Every one knows the position of the sculptor. He astonished the Salon of 1882, and the Médaille d'Honneur was voted to him with acclamation. M. Dalou is one of the forces of contemporary sculpture in France. But whether he was not convinced that Gambetta was an ideal politician, or from some other cause, M. Dalou has not been inspired this time. His Gambetta stands like one of the *bourgeois*, and is flanked, as usual, by allegoric figures.

The jury, composed of friends of Gambetta, with M. Antonin Proust for president, having to choose between the six designs, it was inevitable that M. Aubé should be victorious in the competition. The judges have been just, and public opinion has ratified their decision. But Gambetta's friends have been wrong to have given such proportion to the affair. I do not say that the monument will disappear one day in some turmoil, although that may come to pass. On a summer evening in the Park of Versailles, one stops sometimes before the statue of the Duke of Orleans, which formerly adorned a court in the Louvre, and was erected by subscriptions from the army. It now lies sadly in the fossés of the château, beside many other discarded groups. One never knows in revolutionary countries what future awaits the bronzes and marbles which in a moment of enthusiasm have been erected to notable personages. But while admitting that the third Republic may become eternal, and that the memorial erected in honour of Gambetta may remain in the Square du Carrousel until the end of the ages, still future generations will not the less consider the apotheosis of the Dictator to be a work exaggerated in its pretensions, and a proof of the decadence of monumental sculpture in our time.

On leaving the Beaux-Arts, I can see on the Pont-Neuf the equestrian statue of *Henry IV.*, which stands out in simple and imposing lines against the sky. It is very different from the involved compositions which our sculptors now devise. The illustrious have no need of so great a reinforcement of accessories and such a length of inscriptions on the pedestals. I consider that a simple figure of Gambetta in an oratorical attitude, suggestive of the power of his eloquence, would have better served to preserve the memory of the Dictator than this excess of flowers in bronze and marble which provokes irony.

---

**Senor Cruzada Villamayol**, Director-General of Posts and Telegraphs in Spain, died suddenly on November 29. He was a great supporter of national art, and a recognised authority on painting. In 1863 he founded the journal *El Arte en España*, and in 1866 wrote the catalogue of the National Picture Museum, of which he was at one time sub-director. He was also the author of a work on the Goya tapestries.

## NOTES AND COMMENTS.

PARISIANS being proverbially fickle, it is not surprising that they have grown tired of the Opera House, which is so important a landmark in the city, and are wishful that they could recover the old house in the Rue le Peletier. M. GARNIER's grandiose building does not pay, and there has been difficulty in finding a manager to succeed the unhappy M. VAUCORBEIL. Two gentlemen have now undertaken the office. It has been suggested that the building should be demolished, and the site appropriated to some other purpose. The area is 11,237 square mètres, and at 11,000 francs per mètre the ground would be worth 33,711,000 francs. To this should be added the value of the materials, the sculpture, and mosaics. The group of dancers would probably secure a high price from its notoriety. A new opera house could then be constructed by the State. It may be noted, however, as an indication of the modern spirit, that it is gravely recommended to erect the building without calling in the aid of an architect. One of the causes of the change in feeling towards the Opera House may be the fear of the consequences of having a large number of unemployed men. There is a pressing need of work in the building trades in Paris. It was lately said in the Chamber that two years ago there were 100,000 masons in Paris, while at present there are only 70,000, of whom one-half are without employment.

THE Marquis of BUTE delivered an address on Wednesday in last week, at the distribution of prizes in the successful School of Art at Chiswick. His lordship gave the students the benefit of his late experiences in Greece. The Marquis of BUTE advocated the use of woods, stones, and marbles, without adventitious aid in construction. This is remarkable, when it is remembered to what extent gold and colours have been applied in Cardiff Castle. May the conclusion be drawn that his lordship, like other people, has grown dissatisfied with modern Mediævalism. The colouring of materials was, however, practised by the Greeks as well as the Goths. The address was so well received as to make it a subject of regret that the Marquis of BUTE does not more often give the public the benefit of his studies in art and archæology.

THE Society of French Artists have arranged the conditions for the Salon of 1885. There are some alterations of the established rules. Hitherto the exhibition closed on June 20; it is to remain open until the last day of the month. The whole days on Sundays are not to be free to the public. Up to noon payment will have to be made. The first medal in the section of painting being an exceptional reward will be attainable only by artists who have not gained the honour since the foundation of the Society, or, in other words, the same artist cannot twice obtain the medal. The medal of honour, which was not awarded this year in the section of painting, in consequence of the necessary majority of votes not being forthcoming in favour of M. BOUGUEREAU, will be assigned after a double course of voting. First, a number of artists will be elected by the votes of artists who are prizemen, and in the second place the artist among them who obtains most votes is to have the medal. The arrangements have given rise to dissatisfaction, but it is impossible to have a Salon which will please everyone.

SANITARY associations are not an unmixed good. The report of the Glasgow Association states that in cases where a house had had considerable alterations and improvements effected on it at the suggestion of the engineer of the Association, when the same house came to be inspected twelve months afterwards it was occasionally found that, from various unavoidable accidents, the sanitary condition of the house had become unsatisfactory. In one house, where a pipe had been carefully put in, and afterwards tested and found correct, it was discovered that the workmen, when afterwards tramping in the earth, had broken the jointing, and caused a leak by which sewer-gas escaped into the house. If accidents had occurred through the workmen employed by a builder, we doubt if they would be considered "unavoidable." The remedy proposed by the Association is a more frequent examination. Professor GAIRDNER would have one every year. He described his own house as "a perfect magazine of little sanitary defects," and evidently he has got to like the expense and trouble of

periodical overhauls. His brother professors are also curious about the interior of drains, for within a year after the thirteen houses in the college were erected they were all operated on by sanitary inspectors. For householders who live outside the college in Glasgow, sanitary panics soon lose their attraction. This is the only way to explain the fact that so large a number of members have failed to renew their subscriptions.

MR. ARTHUR EVANS, who has succeeded the late Mr. J. H. PARKER as keeper of the Ashmolean Museum, has, in his first report, fluttered the University authorities. The Tradescant collections, which are the basis of the museum, have been the property of the University of Oxford for exactly two centuries. But they have been neglected, and many of the objects were relegated to a loft, from whence they were rescued in a damaged condition by Mr. PARKER. The rooms were utilised for examinations. It is said that offers of collections of antiquities have been rejected owing to want of space. Mr. EVANS asks for sufficient funds from the University chest to enable him to restore the museum to its original use, and to arrange and extend the collections. There will soon be a Professor of Classical Archæology in Oxford, and the museum will be indispensable to his lectures. Mr. EVANS has the aid of his relative, Professor FREEMAN, and his case is so strong it cannot well be resisted on financial grounds.

MR. AITCHISON, A.R.A., is not satisfied with talking about decorative art at meetings; he is earnest in using his influence to obtain commissions from his clients for artists. A beautiful frieze is in progress in Mr. W. E. F. BRITTEN's studio, which is intended for a town-house for which Mr. AITCHISON is architect. The subject represents a number of children ensnaring birds. The background is formed by apple trees, growing so low as to form a hedge, and helping to bind the composition into a whole. While some of the children are trying to decoy the birds others are looking on. In this case the action of the children is suggestive of childishness. They have neither the skill nor the cunning of the adults who may be seen on Sundays in the fields about London. The modelling of the figures is true to nature. The room is to be hung with amber satin, and the frieze is accordingly painted with a richness that is more allied to Venetian than to modern work. Decoration that is so poetic in conception is unhappily too rare in this country, and it is therefore a duty to support an artist like Mr. BRITTEN.

THE most interesting of the "Annuals" is that which has been issued by the conductors of the *Art Journal*. It is a monograph on the life and works of Sir FREDERICK LEIGHTON. The illustrations exemplify the President's career. Steel plates and wood-cuts from the *Art Journal* have been reprinted, and blocks with illustrations to "Romola" have been lent for the occasion. The publication is fairly representative of Sir FREDERICK's best work, from the time when his picture of the procession of CIMA BUE's *Madonna* revealed a new English master until the present year. The "Annual" is of permanent value as a record of a man of whom England may well be proud. It will be an acquisition to many a student.

A LETTER, signed "X," appears in the *Times* on Thursday, which says it is not surprising that the Decoration Committee of St. Paul's "should, for a solution of their difficulties and a satisfactory discharge of the semi-public charge confided to them, turn to the original plan of coffering the cupola of St. Paul's, in accordance with the recorded mature experience of the architect of St. Paul's Cathedral." As the letter is in "leaded" type it may be assumed to be authoritative, and the conclusion to be drawn is that the Committee consider the designs to have failed. The plan referred to is the model which "is now preserved in a chamber in St. Paul's Cathedral, and displays a coffered cupola, very much after the style of the coffered dome of the Pantheon at Rome." Sir CHRISTOPHER WREN selected this manner of treating his cupola after his travels abroad, where he had studied various buildings. He introduces into the soffits of archways in St. Paul's similar coffering, and thus brings into architectural and decorative unity the different curved surfaces with which he had to deal. It will hardly be creditable to the country if no better solution of the difficulty is attainable.

SKETCHES IN NORWICH, ETC.

WE publish reductions of six of the excellent pencil sketches by Mr. J. GIBBONS SANKEY, which were among the collection that obtained the Pugin Scholarship.

CARRIAGE WORKS, NEWINGTON BUTTS, S.E.

A FEW facts in connection with the illustration of Messrs. ALFORD & ALDER's new business premises may interest our readers. The business was established in 1820 by the late Mr. ALFORD. It had a small beginning, but rapidly grew, and in a few years was one of the most flourishing concerns of the kind in London. One of his first customers was the late Mr. THEOBALD, of sporting renown, who came accidentally for some trifle, and was so pleased with his treatment that he soon proved a good friend, and recommended gigs right and left. The speciality in those days—fifty years ago—was Stanhope gigs (now becoming fashionable again under the name of buggies), which Mr. ALFORD improved, and made lighter and handsomer than hitherto; and such a reputation did he get for this class of vehicles, that at one time he had 365—a fact always remembered because the number corresponded with the days in the year—on yearly contract, besides hundreds that were sold right out and sent to every part of England and abroad. The spread of railways, however, altered all this, for the gigs were used principally for travelling about the country by those whose business and pleasure took them from place to place. However, by adapting themselves to circumstances, the firm continued to carry on a successful trade. The extensive premises have been rebuilt. The arms in the view are the Coachmakers', of which City company the senior partner is renter warden. The company continues its connection with the trade in having many practical coachmakers in its Court and livery. Last year the master and three wardens were all coachbuilders; consequently much is done to improve the trade by offering prizes, &c. The works have between 23,000 and 24,000 square feet of floor space, and every part of the carriage is made on the premises.

The new buildings have been carried out under the direction of Mr. BANISTER FLETCHER, F.R.I.B.A.

NEW CATHOLIC CHURCH, MOSSEND.

THIS church consists of nave, aisles, chancel, baptistery and tower. The nave is divided into seven bays, and is lighted at the west end by a three-light window with traceried head, having a single light window with cusped head on each side. In each bay there is a triplet of quatrefoil windows in clerestory, and a three-light window, with cusped head, in aisle. The baptistery is at south-west angle, and is apsidal in form, lighted by six single-light windows with cusped heads. The tower and spire is at north-west angle and when completed will be 124 feet high. There are two doors at west end, leading into a large porch. The gallery is approached by an angle-winding staircase in tower, and is immediately above the porch, and supported by three arches filled in with a wooden screen and glass. The chancel, which is divided from the nave by an arch, is square in form and lighted at east end by a rose window, and on each side by two single trefoil-headed windows. The side chapels on each side have a rose window. The total length of church is 112 feet, and the width of nave and aisles 50 feet. The height from ground to ridge of roof is 47 feet. The style of architecture is Early Decorated. Carlin stone has been used throughout, with polished dressings and rock-faced facings.

The church has been designed by Messrs. PUGIN & PUGIN, Westminster, and carried out under their superintendence by Mr. JOHN DEVLIN, of Glasgow.

DESIGN FOR WESLEYAN CHURCH, SCARBOROUGH.

THIS design was submitted in a recent competition for a Wesleyan church, proposed to be built upon the South Cliff. The materials proposed to be used were hammer-dressed random wallstones, and red tiles for the roofs, fitted internally with pitch pine and English oak. Accommodation is provided for 400 persons, with school, classrooms, and lavatories in the rear. The total cost, exclusive of spire, would be 3,500*l*.

This illustration is from the design of Mr. JAMES WILSON, architect, Leeds.

ORGAN CASE, OLD RADNOR CHURCH.

THE work which is the subject of the illustration is of oak, and is about the only instance of a church organ case of the Gothic period existing in this country. Although it shows signs of the rise of the Renaissance style in some of its ornaments, it is in many parts enriched with strictly Gothic detail, while in all respects it is arranged after the Mediæval manner. Besides being valuable on account of its construction, it is also very interesting from its position in the church, which appears to be the one it originally occupied, namely, at the east end of the stalls on the north side of the chancel, thus giving at least one instance of the way in which the choir of a church was arranged for service during the Gothic times. The out-of-the-way situation of Old Radnor probably accounts for the preservation of this interesting relic, which, however, prior to its restoration in 1872—when a most exquisitely tuned organ was placed in the old case by Messrs. J. W. WALKER & SONS, at a cost of some 500*l*.—had lost nearly all its pipes and machinery, although it retained sufficient detail of the case itself to render a perfect restoration an easy matter.

Our illustration is from a drawing by Mr. E. KEYNES PURCHASE, P.A.S.I., of the firm of Messrs. MARTIN & PURCHASE, Mansion House Chambers, E.C., which was exhibited this year in the Royal Academy.

## THE BIRMINGHAM ART GALLERY.

THE reports of the Museum and School of Art Committee were presented to the Town Council on Tuesday. It was announced that rapid and satisfactory progress has been made with the buildings of the School of Art and the Museum and Art Gallery, and the question of fittings is now under consideration. The sum originally assigned by the Council as the total cost of the school building was 20,000*l*. Some extremely desirable changes of plan have increased this amount by about 1,000*l*., and the committee report that Messrs. Richard and George Tangye, being convinced of the advisability of the alterations referred to, have generously volunteered to defray the additional cost. Four perspective coloured drawings of the school buildings have been made, and have been presented respectively to Mr. Cregoe Colmore, the donor of the land, and to Miss Ryland and Mr. Richard and Mr. George Tangye, the donors of the building fund, as a memorial of their generous benefactions. The architects, Messrs. Martin and Chamberlain, report that the school building will probably be completed and ready for occupation by the month of June next, and arrangements will then be made for the formal transfer of the work of the school to the care of the Corporation.

In reference to the Art Gallery, the committee report that it is now in a very forward state, and the architect, Mr. H. R. Yeoville Thomason, states that it will be ready for occupation by the end of May next. The whole of the building is roofed in and the roof glazed, the plastering is nearly completed, the heating apparatus is fixed, and the concrete to receive the permanent flooring is partly laid. The committee have accepted from Messrs. Strode & Co. a tender for sunlight burners for the entire series of galleries, at a cost of 488*l*. They have also considered the lighting of one of the galleries by electricity, in accordance with the conditions of the Nettlefold bequest of the David Cox collection, but are not yet prepared to report on that subject. The forward condition of the Art Gallery building, and the prospect of the early occupation of it, have led the committee to consider the subject of the necessary staff required. Their present opinion, after making careful inquiry, is that the permanent staff should consist of a curator or keeper, having the general direction of the galleries under the supervision of the committee, a competent foreman assistant, a junior clerk, and probably three ordinary attendants, who, with the aid of the police in keeping order, will be sufficient. The most important of these officers is the curator or keeper, and in the judgment of the committee it is essential that he should be appointed without delay, and should immediately on appointment enter upon the duties of his office, as the time at his disposal between the present period and the date of opening the galleries will be none too much for the numerous and complex arrangements which will have to be made.

The committee have unanimously decided to recommend to the Council Mr. Whitworth Wallis, of the South Kensington Museum, for appointment as curator or keeper of the Birmingham Corporation Museum and Art Gallery, at a salary of 350*l*. per annum, commencing with the date of entering upon his duties, and as an appointment terminable by three months' notice on either side. Mr. Whitworth Wallis is the second son of Mr. George Wallis, keeper of the art collections at South Kensington, and formerly well known in Birmingham for his valuable services as the first master of the Birmingham School of Art. Mr. Wallis is thirty years of age. He received his early training under his father's direction, and was then sent to Germany, where, in the

eminent house of Messrs. Jacob Ravené, Sons & Co., of Berlin, he acquired a thorough knowledge of the German language, and of German art and manufactures. In 1877 he left Berlin, in order to be employed, under the direction of Sir P. Cunliffe Owen, in the Paris Exhibition of 1878, an appointment for which his knowledge of the French language specially fitted him. In June 1879, in consequence of his efficient services at Paris, he was appointed, under the Science and Art Department, as a technical assistant, with the duties of assistant keeper. In this capacity he arranged and conducted the Bethnal Green Exhibition on behalf of the department; and from October 1880 to April 1883 he performed the duties of keeper in the Indian section of the South Kensington Museum, in the absence of Mr. C. Purdon Clarke (the present keeper of the section) in India. In addition to this service, Mr. Wallis organised, for the department, a collection of Indian and other objects, and conveyed them to Berlin in 1881 and arranged them for exhibition there; removed them to Stockholm in 1882, thence later in the year to Copenhagen, and in the spring of 1883 again removed them to Amsterdam for the Dutch Government Colonial Exhibition of that year. In these various services he had sole charge of all the arrangements connected with the exhibition, and received from the several Governments and others concerned the highest commendations of his energy, skill, and competence for the difficult work in which he was engaged. Since the last-named period Mr. Wallis has been employed at South Kensington, chiefly in the Indian Department. He has thus had exceptional opportunities of acquiring experience in the conduct of art collections both in this country and abroad, and of making himself acquainted with the art of various countries; and from the testimonies they have received, and from their personal conferences with him, the committee are satisfied that he has turned these opportunities to good account, and is capable of efficiently using his experience for the special purposes of the Birmingham Art Gallery.

### WESTMINSTER HALL.

THE following letter from Mr. Butterfield has appeared in the *Times* :—

The old Palace buildings have gone, and I think that Mr. Shaw-Lefevre has done well in letting the late Law Court buildings follow them. They were a clumsy attachment, had done their work, and had no further claim upon us.

We all, of course, know that the west side of the Hall has never at any time been seen from the points of view from which it must probably be seen in future. This has been the fate of many a building before now; such changes are constantly occurring, and must occur. One could make a long list of them. There is no case in this instance for despair. A wall which at any rate was formerly, for a period at least, external, becomes again, by removal of the Courts, an external wall, and must be made in itself as suitable and presentable as may be. Certainly it had better not be concealed by buildings, without much graver reasons than have been assigned for concealing it.

The Hall itself is the point of interest, and the simple question for consideration is what can be made of it, and not how it can best be hidden. I believe that only one thing can be done with it, and that other methods will be unreal, costly, and clogging.

Within, the Hall is dark, and, looked at in connection with the roof, the walls are very low.

Without, the roof is overwhelming, the windows now exposed are mean, and the west side is sunk rather ignominiously in a hole.

There are ways of very much reducing the last-named defect if it is only boldly accepted. We are all accustomed to buildings in which various levels of ground have to be acknowledged. The area of ground to the west of this one is sufficiently large to constitute a handsome sunk terrace, if kept at one dead level approached by steps. If turf is laid on such a large level platform with terrace paths, the buried feeling which the present sloping approach suggests would be very largely abated. Something different would be suggested. Its surface must not be frittered away in flowerbeds, but left in strong and severe lines. The Hall, as I hope to see it treated, will be severe and simple, and with such treatment its entire precinct should agree.

Proportion, light, and dignity are the chief things which the Hall itself lacks. The cure, to some extent, for these defects is a lengthening upwards of the windows, which means, of course, increased height in the walls and a bodily lifting of the entire roof. The existing arched window-heads, which include the tracery, would be the only parts removed. They would be laid aside for re-use, in completing each window after its plain jambs had been continued upwards to an additional height of possibly five or six feet. In doing this it would be desirable to add a plain horizontal transom, slightly above the line of the springing of the heads of the existing windows. Any lengthening of the windows downwards is out of the question. The inside sloping sills of those on the west side must be carefully preserved, and I hope that those of the windows on the east side will be made to agree with them.

How much it has been felt by others that more light in the

Hall is necessary is shown by the range of dormers inserted at the gutter level, which are now boarded up. In Brayley & Britton's "Perspective" these are shown as open and traceried. The roof-work, for want of light, is now largely invisible.

The raising of the roof, which must go on gradually in connection with this raising of the walls, is, by the use of very simple machinery, an easy matter. It would be raised together throughout its whole length, and be wedged, until it reached a height at which some courses of masonry could be inserted, after which the raising it would be again continued. A sufficient amount of careful tying together would be required before any movement of the timbers should be attempted. I will not go further into detail. I merely wish to show that the framing of Richard II.'s roof, the most genuine piece of the entire work, would remain intact, and that it would cover, at the conclusion, the whole area of the Hall as before.

I am sure that these proposals cannot be called revolutionary. A more really conservative course cannot be adopted. It treats Richard II.'s work with a respect which he certainly did not show to that of William Rufus. It involves no destruction and introduces no imaginary features, under the plea of restoration.

The north or entrance front of the Hall must, of course, be lifted as much as the side walls. But I trust that its general proportions, which have always satisfied me, will be kept as nearly as is possible. Its flanking towers seem to me admirably suited to the centre gable, which, however, does not touch upon them quite satisfactorily, as Mr. Pearson sees, and they are entirely enough for the purpose.

I say nothing against building along the street line facing St. Margaret's Church, if buildings are required. But I hope they will not be put up for the mere sake of concealing the west side of Westminster Hall. More things can take care of themselves than some people imagine.

I wrote to this effect anonymously in July last, and I have seen no cause since then for changing my view.

Mr. E. W. Godwin, F.S.A., writes in reference to the foregoing :—

The first half of Mr. Butterfield's letter in the *Times* of to-day as to the treatment of this Hall is in accordance with the true spirit in which the conservation of ancient monuments should be undertaken.

But anything more amazing than the suggestions contained in the second half of this letter I never read. Mr. Butterfield attacks the proportions of the work of Richard II.'s architect, and suggests raising the roof by adding to the height of the walls and lengthening the windows, advancing for this tremendous metamorphosis two reasons, first, that the proportions of Richard's Hall are bad; and, secondly, that the Hall is dark and wants more window-light.

As to the first assertion, I beg leave to differ wholly from Mr. Butterfield. The entire building, like many other buildings—Classic as well as Mediæval—is designed on low, broad lines, depending on mass for its expression rather than on elegance, lightness, or delicacy. The broad surface of its roof is in harmony with the broad, low windows, the massive buttresses and low towers. To lengthen the windows or to heighten the towers would be to put the roof out of drawing, and practically to destroy the Mediæval design.

As to the second reason, if it be conceded that the Hall is too dark, let the roof be pierced by lofty dormers of wood above the line of the eaves, and let these be distinctly modern in design, conveying no pretence of having been copied from Plantagenet dormers, which never existed.

But this suggestion I only advance on the supposition that by no other way can sufficient light be obtained. I venture to say that if the windows on the east side had reflectors outside and artificial light were used to illuminate the roof on dark days, the Hall would have as much light as its architecture requires.

### THE ROYAL SCOTTISH ACADEMY.

THE prizes obtained by the students of the Royal Scottish Academy during the past session were presented on November 26. Mr. W. McKay, as senior member of council, presided, in the absence of Sir William Fettes Douglas.

Mr. Geo. Hay, the secretary, read the report of the visitors of the Life School, which stated that they had much pleasure in testifying to the diligence and the progress of the students generally. The aggregate evening attendance during the session had been 2,040, or an average of 17 per night; and 1,729 was the aggregate morning attendance, being an average of 15 per morning. The council were glad to observe the generally high quality of the work. The awards were as follows :—For painting from the life (the Chalmers prize), C. A. Sellar and J. Bowie (equal). For the best drawing from the life, T. Allison; for the second best, J. K. Ferguson and G. Denholm Armour (equal). Keith prize, for the best work of a student in this year's exhibition, T. Scott and G. D. Armour (equal). Maclaine Waters medal, C. A. Sellar. Stuart prize, T. Scott and C. Mackie (equal).

The Chairman said it was gratifying to them to feel that year after year the old perverid temperament of Scotland sent forth new bands of students to carry on the torch of art in a country which was not blessed in many ways with that which tended to the promotion of art. It was pleasant for them all to think that, whatever position Edinburgh and the Scottish Academy must occupy in the near future as a centre of art, as a nursery of art there was no falling off—indeed, very much the opposite, he thought, within the time he could remember. They were met now to distribute to the successful students those awards which were given by the Academy, and by several generous donors who in times past had taken an interest in art. A good deal had been said on the subject of prize-giving and prize-taking. It had been argued that the whole system was wrong; that the pursuit of anything ought to be for its own sake. Well, perhaps in the abstract that was true; but unfortunately, or perhaps fortunately, they could not regulate all their affairs by principles of abstract truth. He thought all of them must be aware that although the main incitement to their endeavours in art had been the love of art, yet there had been times when such stimulus as that which was about to be given to the successful students had advanced them not a little. Indeed, some of them, he durst say, had felt that even such mercenary influence as the sale of an important work had given them a stimulus at times, although far be it from him to say that that ought to be a thing of much consideration. It had been said, sometimes said, that this system of prize-giving had a tendency to make those students who had been successful rest on their oars; and it had been observed that in the following year or following years those students had not attained to what might have been expected of them. Well, if there was a tendency of that sort amongst any of the students, he could give them a cure for it, and that was to cherish a high ideal of their profession. No one who thought what art was, who had any just conception of what art was, of the noble calling to which they were called, could be checked in his aspirations by such a thing. Therefore he would say, "Take your prizes with an easy conscience and an easy mind, and look forward to still further triumphs in many directions." He had said theirs was a noble calling; he thought it was one of the noblest; it was nothing but the propagation of the gospel of beauty. He thought it was a noble thing to go abroad to preach that gospel, and he would just say, before closing, that they were each and all required, not only to preach that gospel by showing it in their works, but by their personal influence; for he thought the personality of an artist counted for almost as much in the education of a nation as exhibitions and museums, and the public exposition of one's works. It seemed sometimes to be a long-delayed thing, this education of a people in the art direction. Sometimes they thought there was no progress making at all; but he did not think so. He thought it was quite perceptible. He was lately assured by a friend who took great interest in art, and who had resided long in one of the great towns of Yorkshire, that coming to Edinburgh was like coming into a different atmosphere in matters of art. So that those old founders of the Scottish Academy had not lived in vain. It was a heroic struggle they made. Quite recently, by the thoughtfulness of their librarian, the members and Associates of the Academy had been presented with a work on its early struggles by the late Sheriff Monro. Reading in that work, they were struck with the heroic struggle that those founders of the Academy made, and they were glad to be able to say they had not struggled in vain.

Mr. Barclay proposed a vote of thanks to Mr. Clark Stanton, the Curator of the School, who, he said, had attended most assiduously to the interests of the students.

Mr. Clark Stanton, in responding, said that earnest, thorough-going work had been the chief characteristic of the class. As to the travelling studentship, he thought it was a great pity it should not be something more than a name. Of course 50*l.* was all very well to put into one's pocket if he had the other 150*l.* there already, but 50*l.* was altogether inadequate for a year's study and travel; and he thought that if it were known what was wanted, something more would be forthcoming. He did not see why the sculptors should not have a travelling studentship as well as the painters. There was not much encouragement given to the sculptors generally. If a sculptor asked for bread, they did not even give him a stone—to cut; and when a good opportunity occurred for a man's distinguishing himself, such as that just past of the Buccleuch statue, it was sent away south. He thought that was a great mistake and a great pity; and it would be a very unfortunate thing if they came to be in the position of the great town of Liverpool, which had an academy and no sculptor. He hoped, however, they would take a little comfort when they could, and congratulate themselves on what had happened lately, and congratulate Mr. Grant Stevenson that, on this occasion at any rate, Wallace was not to be sent to London to be executed.

On the motion of Mr. Gourlay Steele, a vote of thanks was tendered to Mr. M'Kay for presiding.

**Advanced Schools** are about to be erected in Algiers by the French Government, which will cost nearly two millions of francs.

## THE CITY COMPANIES.

### 4. The Joiners' Company.

THE Joiners and Ceilers appear to be one of the ancient fraternities or mysteries of London. Having presented a petition for a charter to Queen Elizabeth, one was granted on April 14, 1570, incorporating and making them into a body and commonalty perpetual. It was ratified on July 20, 1570.

The charter grants that the body or community may yearly and every year elect and make of that commonalty one master, two wardens, to survey, govern, order, and correct the commonalty for that year, and all men, servants, and apprentices of the trade in the City of London and the suburbs, or within two miles in circuit of the City. It is, amongst other things, further granted that none exercise the mystery or faculty within the City or suburbs of London, or within two miles, except he should be thereunto admitted by the master, wardens, or their successors for the time being.

The acts and ordinances made by the master, wardens, and assistants, with the assent of the commonalty of the mystery of Joiners and of Ceilers or Carvers, were duly allowed by the Lord Keeper and the Chief Justices of the King's Bench and Common Pleas. In these by-laws it is noticed that there were then twelve assistants of the mystery or faculty. It is therefore ordained that at all times thereafter there shall be twelve persons chosen by the body or commonalty of the mystery to be assistants to the master and wardens, and whensoever any of the said twelve assistants shall die, or be deprived, or depart out of the City of London or suburbs to dwell and remain out of the City and suburbs by the space of one whole year, that then the commonalty, within fourteen days after every such decease, deprivation, or departure, shall and may elect and choose at their common hall in the City of London one other person as a new assistant, being one of the society, so that there may be continually twelve assistants to the master and wardens.

It is further ordained that on the feast day of St. James the Apostle, and so yearly from thenceforth for ever, the commonalty, or the more part of them, elect one master and two wardens, to hold office for one year then next ensuing. Some subsequent by-laws, dated April 8, 2 James I., were confirmed by the Lord Chancellor and the Chief Justices of the King's Bench and Common Pleas; and there is also a book entitled, "By-laws of the Company of Joiners," made 1740, regulating fines, &c., much of which is obsolete or altered by subsequent regulations.

About the year 1613 great disputes arose in the company touching the mode of electing the officers. It was urged by those members who were working joiners that, according to the true construction of the charter, no one ought to be master or wardens of the company but such as should be working joiners, and for that purpose chosen by the "whole multitude," by which they would have excluded all members belonging to other trades from their places of government in the company. A suit in Chancery was instituted, arising out of a money payment connected with these transactions. An order was made by the Court, dated March 2, 16 James I., whereby the matters in difference were referred to two aldermen, who, upon hearing of the parties, directed that the election of master, wardens, and other officers should be made by the assistants and livery of the company, as it had formerly been, and not otherwise; and that the master and wardens so from time to time elected should be of those which should be of the livery of the company without respect of trade. By consent of all parties this award was adopted as an order or by-law of the company, and the same having been certified unto the Court of Chancery, it was, on June 25, 17 James I., decreed by the Court that the order should be ratified and confirmed, and that the company should be as absolutely bound and concluded thereby as if the same had been judicially heard and decreed upon a solemn hearing of the cause. All such proceedings are exemplified under the Great Seal.

The charter grants that none shall exercise the mystery or faculty of joiners and ceilers within the city and suburbs, or within two miles of London, except he be admitted by the master and wardens; and also, that they shall have the search, survey, and government of the commonalty of the said mystery, and of the works and merchandise within the before-mentioned limits. The by-laws, founded upon the charter of 14th Elizabeth, establish that the coach-makers, trunk-makers, box-makers, cupboard-makers, foreign joiners, and joiners free of other companies, gunstock-makers, and flask-makers, within two miles circuit of the City of London, shall be subject to the government, &c., of this company.

Various orders of the Court of aldermen have also been made for the purposes of enabling the company to exercise those privileges; and an act of common council was also passed, October 9, 6 William and Mary, for the purpose of compelling all persons exercising the trades of joiners, carvers, box-makers, &c., within the City of London, and two miles circuit of the same, to become free of the company.

Conflicting claims have in former times been preferred by the carpenters, gun-makers, and other companies, and disputes have

arisen with them; but these transactions date at a very distant period, upwards of 150 or 200 years ago, and the company do not attempt to enforce their jurisdiction, nor are persons carrying on the trade of a joiner compelled or required to enter the company. Persons of that trade do not prefer the company, and in fact very few belong to it.

The powers given by the charter and act of common council in relation to the "faculty" have been carried out, but the searches, which the charter authorises, have long been discontinued, and the company no longer exercises any control over persons carrying on the trades which it was originally intended to govern and regulate.

The governing body of the Joiners' Company consists of a master, upper warden, renter warden, twelve assistants, and the Court of livery. The master and wardens are elected by ballot. No liveryman is eligible for office who has been a bankrupt or has paid less than 20s. in the pound. The Court holds the chief control. Two Courts are held during the year, and special Courts are called when vacancies occur in the Court of assistants. A fee of 10s. 6d. is paid to liverymen and members of the Court of assistants who attend at the livery meeting.

Sons of freemen and persons who have served the full term of seven years' apprenticeship to freemen are admitted on the qualifications of patrimony and apprenticeship respectively. Other persons are admitted by purchase. The various grades are:—(1) Apprentices, (2) freemen, (3) liverymen. All liverymen must be elected by the Court of assistants. Freemen can claim their admission by patrimony or servitude, and by election by the Court of assistants in case of purchase. Freedom may be obtained by patrimony, servitude, and purchase. The following fees are paid:—Patrimony, 5*l.*; servitude, 5*l.*; purchase, 12*l.* The fees on election for steward are 13*l.* in all cases. The fees to livery are for freemen by patrimony, 20*l.*; freemen by servitude, 45*l.*; freemen by purchase, 80*l.* There are now about one hundred freemen and ninety liverymen. Many of the livery are box-makers, builders, cabinet-makers, carvers, and gilders.

## BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE first ordinary meeting of the current session was held at Queen's College on Tuesday evening, December 2. The vice-president, Mr. W. H. Kendrick, was in the chair. Among the members present were Messrs. T. W. F. Weston, F. Bailey, H. H. McConnal, H. Lloyd, A. Hale, S. T. Reavell, H. Beck, Victor Scruton (hon. secretary), &c. The secretary read the report and balance-sheet for the past session, and pointed out that the financial position of the Association had never been so satisfactory as at the present time. The following gentlemen were nominated for membership:—Mr. F. J. Yates as an honorary member, and Messrs. W. S. Midgley and S. Payton as ordinary members. A paper was then read by Mr. T. W. Newton, entitled the "English Villa." A discussion ensued, and after a hearty vote of thanks to the author the meeting terminated.

## THE MARQUIS OF BUTE ON GREECE.

AN address was delivered on Wednesday in last week at the Chiswick School of Art by the Marquis of Bute, after the distribution of the prizes to the students. His lordship said that he had the pleasure of being recently in Greece, and he thought he might make the present occasion both interesting and valuable to them as artists if he gave them a kind of report of the actual condition in which some of the most celebrated art centres in Greece were now. He had no doubt they knew as well as he did the art centres of Greece, especially of Athens; and at the same time, there were excavations constantly going on which continually changed the amount of matter exposed to the interest of the artistic world. Of course the Greeks could not boast of those large collections of works of art the museums of which were to be found in Italy and other places. The charm which invested Greece to a great extent depended either upon history or upon nature. For instance, there was Thermopylæ, the glory of which filled the world with wonder. A great deal of the attraction of Greece lay in the perfection of climate and the admirable atmosphere, which the ancients themselves remarked. They imparted to some aspects of nature a specially beautiful colour, and made works of art appear to an advantage which they did not seem to possess elsewhere. Speaking of Athens, his lordship referred to the discovery at the Acropolis of some marble statues upon which there was a great deal of colour. It faded very quickly after the statues were excavated, and the Archæological Society there had to employ artists to take a photograph of them. They were of extreme antiquity; and the colour of the skin, the eyes, the lips, the hair, and the colour of the inside of the garments were represented. In one case he remembered seeing the representation of an under garment of very slight fabric looped down the arm to show the skin through the openings in the blue material; and that had been done simply by painting. Speaking of the original Theatre of Athens, his lordship said it did

not seem to have any stage at all. The actors merely proceeded from the architectural scene behind to the level space in front of the audience. It was extremely to be regretted that no catalogue was published of the contents of the National Museum of Greece. The museum itself was incomplete. He understood the galleries were filled with works of art, and no proper place had been prepared for them. Statues were lying about in fragments, as no time had been found to restore them. What was known to foreigners as the Bazaar in Athens had been burned down within the last two months. It consisted merely of wooden shops. He understood that the market was now to be translated to the new market now in course of erection, so as to make careful examination of the ground of the former, which would remain for ever open. His lordship proceeded to refer to the discoveries made during the excavation at Eleusis, the sanctuary of which was the most interesting in the way of antique remains of any in Greece, so far as he saw. The present town was built on the actual site of the sanctuary; and the inhabitants, knowing the value of that part, had put a price upon their houses, which up to the present time the Archæological Society had found entirely prohibitive in regard to the work of excavation. After pointing out that the discoveries at Eleusis, as well as at Olympia, showed that plaster and painting had been used on the works of art, he proceeded to speak of Sparta, and observed that it was a most singular thing, considering the important position which it filled in history, there should be so little of it left to indicate its former importance. It brought to mind the almost prophetic truth of the remark of Euripides, that owing to the neglect of art by the Spartans, as compared with the attention given it in Athens, the traveller of the future would find it difficult to form a just estimate of the comparative political importance of these two cities of Greece. Unfortunately many of the sculptured stones of great antiquity at Sparta had been used in the building of the modern town Mistia, and those marks which indicated the style of architecture had to a great extent disappeared. He thought greater interest should be taken in the works of Greece, both on account of their historical value—a value which was shared by the Roman and even by the Turkish remains—and of their importance as representing the traditions of classical painting. The Greek nation at the present moment indulged in a certain amount of recklessness in regard to ancient works of art, as they were rather inclined to look to an ideal glory and greatness to which they proposed to attain in the future, than to try to find any lessons from the works of their ancestors. But he believed that now the Greek Government had begun to pay more attention than before to the subject. Before he left Greece he knew that they had entered into a treaty with mosaic artists from Venice to come and see to the state of many of the valuable works of art being discovered.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

THE usual fortnightly meeting of the Edinburgh Association was held on Monday, the president, Mr. G. Washington Browne, in the chair. Mr. James Anderson read a paper, entitled "Roofing Slates and Slating," in which he explained that slate was composed chiefly of silica and aluminum, with the addition of a little iron, lime, magnesia, &c.; the blue slate, which was most common, deriving its colour from iron in the form of protoxide, and the red and purple varieties from iron in the form of peroxide, while green slates, much less numerous, derived their colour from a combination of iron and magnesia. The principal impurities in slate were sulphide of iron and carbonaceous matter, which, when finely disseminated throughout the slates, gave them a blackish colour, and caused them to decompose readily on exposure to the weather. Pyrites, in the form of compact cubes in hard rocks, as in some Scotch and Welsh varieties, did not weaken the slate. True slate was of a beautiful crystalline structure, and the impurities, also, were often found to be crystallised. Frost and exposure to the air affected the cleavage of slate blocks. A frost rendered slate more fissile, but a supervening thaw made them quite refractory. A new frost, however, restored the faculty of splitting, though not to the same extent. When exposed to the air and dried in the sun slate blocks lost their sap, and did not split well. Slate was worked principally in open quarries, but sometimes it was wrought underground by shafts and galleries. The proportion of rubbish to manufactured slates was sometimes as high as thirty tons to one. But in paying quarries, one ton of finished slate to twelve tons of rock was considered good. Proceeding to treat on slating, Mr. Anderson said that the Scotch style was to use thick slates of various sizes, arranged before commencing, and fixed to sarking-boards. The largest slates were put on at the eaves, and they diminished in size to the ridge. The tile-stones or grey slates of Forfar and Caithness were those with which a large portion of Old Edinburgh had been slated. They were hung on lath with pins of oak, pine, and other woods, as well as with the bones of small animals. There were three most important points to be looked to in slating—the pitch of the roof, the cover, and the bond of the slates. Slate was also used for many other purposes besides roofing, such as cisterns, baths, brewers' coolers, &c.;

while slate containing iron and sulphur (*Lapis Hibernicus*) was taken in a glass of gin by the common people as a remedy for internal bruises. In conclusion, the lecturer said he would impress architects with the necessity of providing easy access to chimney-heads, and avoiding traffic on the slates. These accesses need not be unsightly to be efficient, and roofs so protected would not require repairs for many years. A discussion followed, and at the close a hearty vote of thanks was accorded to Mr. Anderson for his lecture.

### JAPANESE ART.

A PAPER on "Old Japanese Art" was read by Mr. Robert M. Young, architect, at the meeting of the Natural History and Philosophical Society of Belfast on Tuesday evening. Mr. Young divided his paper into different sections. The first was devoted to a short sketch of the history of Japan from the time of the Emperor Jimmu, 660 B.C., to the year 1868, when the country was opened to foreigners, and that marvellous series of changes was inaugurated which has transformed the country from being the most backward to the position of the most civilised and enterprising State in the whole of Asia. The lecturer then proceeded to treat of the feudalism which formed so curious a part of the internal economy of Old Japan. He showed that it was almost identical with the military feudalism prevalent in Mediaeval Europe. The daimio, or baron, was then described. His territory and castle, with the dwellings of his vassals, the samurai, were shown to completely resemble the strongholds of the Middle Ages, as depicted in the pages of Froissart and Scott. The outline of the most popular Japanese tale of chivalry, the "History of the 47 Ronin," was given to show what loyalty and devotion were displayed by the retainers to their lord in critical times, death being always preferred to dishonour. The swords of the various periods were described in detail, and some interesting facts given of the etiquette practised with regard to that national weapon. A quotation was given from the "Romance of Prince Cengi," written by a learned Japanese lady in the tenth century, to show what advanced ideas were prevalent at that remote period with regard to art. Even the modern catch-words of "correct taste and high æsthetic principles," are found in this remarkable novel. A few of the leading facts in the history of Japanese art were then noted, particularly as regards the life of the Hogarth of the country, the renowned Hokusai. By the kindness of Mr. W. H. Patterson, his famous work, "The One Hundred Views of the Mountain Fusi-yama," was exhibited to show his skill. After a full explanation of the general principles on which their art is founded, and a description of the way a Japanese artist works, a quotation was given from Mr. W. Anderson, illustrating the distinction between the ordinary artisan and the inventor artist, who, gifted with talents of a very high order, designed and carried to completion the splendid works in bronze, porcelain, and lacquer which have reached Europe. Some amusing instances of the marvellous skill said to have been attained by the old masters were cited, such as that of the artist who drew a dragon, and, as he completed the eye of the monster, it rose and flew away. The famous horse painted on a temple screen was also mentioned, which was nightly accustomed to leave the picture and roam the rice fields, but was at last recognised, and its ravages stopped by blotting out the eyes of the masterpiece. The different substances employed in their art industries were indicated, and the concluding portion of the lecture was devoted to describing the more important, such as lacquer, ceramics, metal-work, and enamels. A concise history of the methods employed in lacquer was given, and examples of this beautiful art shown, more particularly on sword mountings. A fine example in the possession of the reader was exhibited, with eight distinct varieties of lacquer used on it, besides many other processes of inlaying and other arts peculiar to Japan. The remarks made on the various kinds of pottery and porcelain were illustrated by specimens of each manufacture. The stone wares of Hizen, Rako, and Soma were discussed, and the porcelain of Kaga and Kioto; whilst the famous Satsuma and its imitations were fully explained. The subject of metal work occupied some time, as, by the kindness of Mr. Henry Matier, J.P., a very choice collection of the finest old bronze and inlaid work was exhibited and described. Much satisfaction was expressed among the audience that the late disastrous fire had not materially injured any of these masterpieces. The subject of bronze casting was entered into and a brief account given of the Japanese process of founding, known as "cire perdue." The different subjects commonly chosen for delineation by their craftsmen were mentioned at length. The religions and mythology of the country were briefly touched on, the seven favourite divinities and the five monstrous animals frequently found on their art productions being remarked on, and examples of some of them pointed out as fashioned in bronze, pottery, and enamels. The subject of enamels was taken up in the last place. The superiority of Japanese work was indicated by a comparison of some examples of the middle period, in the form of plaques and vases, with old Chinese work. The lecturer then concluded by giving a short description of some of the beautiful works in bronze and other metals kindly lent for exhibition on the occasion by Mr. Henry Matier, J.P. Fortunately,

they have sustained little or no damage from the recent fire at Dunlambert. Much satisfaction was expressed by the audience that this was the fact. A large flower vase from a Japanese temple, cast in bronze, and properly inlaid with silver, having panels on each face in raised metals, one representing a god seated beside the national vehicle, the jinrishka, was much admired. Another was particularly noticeable for the skill with which a dragon, encircled by clouds, was depicted. A large plaque, with a monstrous cuttle-fish seizing an unfortunate wretch, who has endeavoured to pilfer a vase lying on the sea beach, was much remarked for the masterly skill displayed in its manipulation and the precious metals used. Specimens of the best work, in wrought iron, inlaid with gold, and chased in high relief, were also shown. The incense burners, of elaborate bronze work, were unique of their kind.

### THE PARLIAMENTARY COMMITTEE ON WESTMINSTER HALL.

THE Select Committee on Westminster Hall met again on Tuesday, Mr. Shaw-Lefevre in the chair.

Mr. Charles Barry laid before the Committee some plans to which reference had been made at a previous sitting in regard to the practicability of carrying out his father's plan of 1855, without making the roadway between Westminster Hall and St. Margaret's Church too narrow. The plans showed that a roadway might be made of the width of 83 feet, the widest part of Parliament Street being 67, and no part of the roadway running by Parliament Square being wider than that. The actual carriage way would be 55 feet, as against 37 feet 3 inches now, in the narrowest part. If the buildings now protruding were moved 50 feet, that would leave a court of 40 feet wide at the south end, and of 59 feet at the north. He proposed a gallery or cloisters one storey high, which would have no effect with regard to the height of Westminster Hall.

Mr. Shaw-Lefevre asked whether he thought a space of 40 feet from the proposed building to the main wall of the Hall would be enough to allow sufficient light to enter the Hall.

Mr. Barry answered in the affirmative. With regard to the question which had been put to him as to whether his father had raised the floor of Westminster Hall, he had stated that he did not think so. He had since obtained the most precise information he could on the subject, and had ascertained, on the authority of a gentleman (Mr. Pressland) who assisted his father in the office in 1855-56, that the question of how the roof of the Hall could be safely raised by mechanical means was discussed, but it had been no part of the scheme to make any alteration in the level of the floor of the Hall. It was a fact that the building Sir Charles Barry proposed to place in front of Westminster Hall was very much of the same character of design as the existing front of the House of Lords building. He (Mr. Barry) had expressed a strong opinion as to the insufficiency in height of the rooms proposed by Mr. Pearson in his cloister—insufficient for committee-rooms.

Mr. Shaw-Lefevre: But are they not sufficiently high for other purposes?

Mr. Barry: No doubt uses might be found for them, but I should think they would make very inconvenient committee-rooms.

Mr. Shaw-Lefevre: Does it surprise you to hear that some of the committee-rooms in the House of Lords—the room, for instance, in which the Railway Commissioners sit—is only 30 feet long by 20 feet broad and 13 feet high?

Mr. Barry said he was surprised to hear it if they were intended for committee-rooms, but that did not alter his opinion as to the insufficiency of the size and height of Mr. Pearson's rooms.

Mr. Shaw-Lefevre: Do you know that there is not a single room over 13 feet high in the Treasury building?

Mr. Barry: I know that they are very bad rooms for official purposes.

Mr. Walter: Do you consider the room we are now occupying very good?

Mr. Barry: I consider these committee-rooms very good in height; but when they are too crowded they need more floor space.

Mr. Shaw-Lefevre here observed that he should like to give evidence on this point. During the time he had held office he had had to consider the accommodation and arrangements of the Parliament building perhaps more than any other First Commissioner; therefore he thought it was desirable that he should put his views formally before the Committee. The Committee would be surprised to know what a large proportion of this great building was occupied by private houses, and his idea had always been that additional accommodation might be found in the building by reducing the private houses, especially those of the officers of the House of Lords. There was no earthly reason that he could see why those officers should live under that roof, and he had suggested to the House of Lords that they should use those rooms as committee-rooms and find accommodation for their officials elsewhere. That matter he should be prepared to state his views upon if he were to give evidence.

In reply to Mr. D. Peddie, the Chairman said he thought there would be no objection to other members of the Committee giving evidence.

Mr. J. J. Stevenson said the proposal of Mr. Pearson would be an unwarrantable tampering with and alteration of an old historic building, a record of the past, which ought not to be altered merely to suit our views of what ought to be. He objected to the alteration of the towers, which would give the Hall the appearance of a church. His idea was that four considerations ought to be taken into account in the restoration; one was to restore an ancient building; another was to preserve the wall of Westminster Hall; another was to complete Westminster Palace properly; and finally, to make a really useful building of what was added. He felt no desire that the side of the Hall should be covered. He would readily see it left open. He did not know the intention of those concerned originally, but he thought they were indifferent whether the west wall should be seen or not. He would prefer Barry's plan to be carried out if a building was to be put there. But he would leave the wall and cover it with "post and pan" work, or a wooden framework with plaster and two rows of wooden windows. With the buttresses he should seek to produce picturesqueness rather than beauty. If the buttresses were developed as much as possible his suggestion would not be out of harmony with the rest of the building, and the public would admire it, especially if the open space were laid out in grass. His idea was that as the west side of the Hall was exposed it should now be restored as little as possible. His plan would not cost much, but that ought not to be a consideration. He objected to Mr. Pearson's restoration, because it pretended to be what it was not—a restoration, and in building it, he believed all the old work would be destroyed. Mr. Pearson's plan he believed would lead to the ultimate destruction of the wall of Westminster Hall.

Mr. Walter: You recommend this plan of covering the wall with beams and plaster as a temporary measure? What lies at the bottom of your mind is that Sir C. Barry's plan will at some time or other be carried out?

Mr. Stevenson: I think that if more rooms are wanted for Parliament the right thing to do would be to carry out Sir C. Barry's plan.

Mr. Walter: Supposing neither Sir C. Barry's nor any other plan were carried out to increase the whole building, would you contemplate this plaster scheme of yours as a permanent arrangement?

Mr. Stevenson: Yes; I see no reason why we should not preserve these buttresses and walls as long as we can.

The Committee afterwards adjourned.

### GLASGOW HOUSES.

A MEETING of the members of the Architectural Section of the Glasgow Philosophical Society was held on Monday, when Mr. James Thomson, architect, read a paper on the subject of "Other Hindrances to Health in our Homes." Mr. James Sellars occupied the chair.

Mr. Thomson remarked at the outset that it had been said that a great many articles manufactured were made not for use but for sale, and the saying had been unfortunately extended to dwelling-houses generally, many of which had been got up for the market to enrich builders. The title which he had chosen for his paper suggested many things, but he would have to confine himself to one or two matters regarding the erection of houses which he thought were deserving attention. He would avoid drainage, as it had been so fully discussed and written about of late that the public were fully enlightened on the subject. It was to be regretted that in Glasgow the architects had not a greater control of the buildings put up. He thought there ought to be a separate Building Act for Glasgow, such as the Institute of Architects had been urging upon the authorities for many years past. In erecting a healthy house the first thing to be seen to was the preparation of the site. In a city especially, where they were confined to a limited plot of ground, they could never be certain of the kind of site they were about to build upon. Upon the Blythswood Estate he found a site which gave him every satisfaction, and he founded his estimates for a building just across the street on the assumption that a similar site would be found. When the ground was opened, however, they found nothing but a moving mass of mud, which required to be dealt with most carefully. There were so many old covered up streams and water-courses that a kind of soil was sometimes encountered they probably had never thought of. He reminded the members that by means of the Underground Railway works now in progress they could obtain many valuable hints as to the soils for sites along the route. A bad feature to be met with in Glasgow was in connection with houses built upon sites made up of all sorts of rubbish, from which, after the house was erected, gases arose which defied the doctor and all his powers. He advocated the laying down of a strong layer of concrete, which would prevent gas from the soil entering the house, while it could be grooved for the putting in of the soil-pipes, and would enable them to be got at at any time. The next cause

of unhealthy houses was the complex system of water fittings in many houses, the connections of which with the drains were of the most defective character. He would have all such connections with dressing-rooms, next to sleeping apartments at least, done away with. Then there was a great deal of annoyance and injury to health caused by gasfittings being either badly put in or getting damaged, admitting of escapes, often of a serious kind, and in bedrooms and sitting-rooms a most unwholesome atmosphere was sometimes generated. The improvement and development of the electric light would, he believed, in the end tend to obviate this. Smoky chimneys, with all the irritation they occasioned in households, were also detrimental to good health. Notwithstanding the many excellent devices for curing smoky chimneys brought out of late, the best remedy was good and careful workmanship in the erection of the buildings. Indeed, in all departments this was of special importance in itself, in order that a healthy house might be built.

A discussion followed, and the proceedings terminated with votes of thanks to Mr. Thomson, and to Mr. Sellars for presiding.

### THE BLACK GATE, NEWCASTLE.

AT the last monthly meeting of the Newcastle Society of Antiquaries it was reported by Dr. Hodgkin that the Black Gate Committee were nearly at the end of their labours. They had paid the contractor much the larger part of his bill, and paid for the cases and so on. They, however, saw a prospect of being a little short. He was not prepared with an exact financial statement, but he thought they might perhaps want about 100*l.* more or less to complete the Black Gate as they should like. What they suggested was that they should have a formal opening of the Black Gate, at which, no doubt, their President would preside, and make them one of his interesting and heart-cheering addresses, and at which they should also try to get some of their friends to make up the deficiency which still exists. It had been suggested that it would be well to have a loan collection at the Black Gate on the occasion of the opening, in order to give a little more *éclat* to the occasion, and they fancied that most of their Northumbrian friends would be willing to aid them by contributing any objects of interest they might have. The loan collection exhibited during the archaeological week scarcely received justice, as people were busy visiting Lindisfarne and other places, and if it met the approval of the Society, the committee suggested that at the opening of the Black Gate there should be another loan collection exhibited, and that it should be more especially Northumbrian. They suggested January 3 as a suitable day for the opening. It was agreed that there should be a formal opening of the Black Gate, that the secretaries should proceed at once to get together a loan collection for exhibition on the occasion, and that decision as to the exact date should be left to the council.

### THE CONSTRUCTION OF FIREPLACES.

AN informal lecture on "Fireplaces" was delivered on Monday to the members of the Leeds Architectural Society, by Mr. T. Pridgin Teale, M.B. The lecturer said he had accepted the invitation in the hope of being able to enlist the judgment, sympathy, and active help of the architectural profession, who could do more than any other body of men in the furtherance of the object he had set before him, viz., to revolutionise the system on which the fireplaces of this kingdom are constructed. By his plan coal could be burned most effectively and economically as a producer of heat, with at the same time the amount of smoke very materially reduced. In the national work of smoke abatement architects could render most efficient aid, as in their hands rested almost universally the designing of the fireplaces of new buildings. He had discovered that nearly every existing fireplace could be made more effective, more perfect in the combustion of cinders, and more cleanly. The means adopted did not require any structural alteration; the simple expedient of closing the hearth chamber by a movable shield which he had called an economiser was alone necessary. He had already said that this could be beneficially applied to every existing grate. Severe as was the test for such a simple contrivance, it had stood the trial remarkably well. The lecturer then stated the various principles on which fireplaces should, in his opinion, be constructed. A discussion followed, in which several of the members joined. The Chairman (Mr. E. Birchall) said he had tried the economiser in his own home, and it had resulted in a saving of fuel. Mr. Lewis, the curator, agreed that fireplaces should be made of fire-brick as much as possible, seeing that fire-brick accumulated heat, and caused it to radiate into the room. Why, then, should an iron fire-grate be used? A perforated fire-clay grate might be substituted. Stoves should not be recessed; projecting fronts would be an improvement.

Mr. Teale agreed with the use of a fire-brick grate, but pointed out that it would require to be of great thickness. The iron grate

in this case, however, did not conduct the heat away. The projecting fronts would doubtless obviate the necessity of a back formed to throw the heat into the room. In reply to Mr. Armistead, Mr. Teale said that the economiser, ugly as it might be, had answered well in old-fashioned houses, where the height of the fire formed a large air-chamber. It did not matter whether a house was in a crowded or an isolated place, or what number of doors or windows a particular room had, for the success of the economiser. Accurate fitting was desirable, though it was not absolutely essential. He had had fires on this system for three or four years, and the fire-grates had not burned out. He heard they had done so in certain cases. Perhaps in those instances it was the fault of the iron, and it was for makers to ascertain whether cast iron or wrought iron was most suitable. He would recommend the bars to be crosswise and not lengthwise, and that they should be only about a quarter of an inch apart. The grates should also be movable if possible. In answer to Mr. Bulmer, Mr. Teale said that, within reason, the size of the hearth-chamber was not very material.

Mr. W. H. Thorp spoke of the success of the use of the Rifle-back stove. He remarked that Mr. Teale seemed to be a social reformer. He had shown them how to drain buildings, and now he was teaching them how to arrange their fireplaces. He was pleased to move a vote of thanks for the lecture.

Mr. J. W. Canon seconded the motion, saying that Mr. Teale's position was so strong as to be beyond criticism. He pointed out that architects, of all other men, were less able to introduce novelties, as it was necessary to be thoroughly convinced that they would do all they claimed to accomplish before adopting them.

The motion was cordially adopted.

In reply, Mr. Teale, referring to Mr. Canon's remarks, said that he found the hot-air chamber more advantageous than in the case of bricked-up stoves. Probably in a room with 15,000 cubic feet radiated heat would not be ample for warming, and conducted heat might be necessary. He was satisfied that in three years' hence most of the people in the kingdom would believe in the utility of the economiser.

#### The Decoration of St. Paul's.

SIR,—I shall be glad if you can spare me space for a few lines on the above, especially as I feel that I perhaps failed to clearly explain myself at the Institute.

After such great artists as the late Mr. Stevens and Mr. Poynter, and others, have, after full consideration, been in a manner entrusted to design the decoration of the dome, it seems to me very ungracious, and almost unprofessional, for such a body as the Institute to lend itself to such criticism as is concerned in the suggestion of alternative schemes. If the greatest artist that ever lived was to arise in our times, one may be quite sure that he would meet with quite as much opposition and counter-suggestion as either Mr. Burges or Mr. Stevens. It is doubtless annoying to many of us that we were not in a position to make our voices heard at an earlier period; but we may be quite sure that, should we be now consulted, the rising generation would not exempt us from the same process of criticism. At the same time, there seems to be no reason why we should not at this stage by temperate criticism try and improve the design sketched out. The artists selected are probably open enough to consider any suggestions that may be of value.

In such remarks as I made at the Institute I by no means wished to suggest another scheme, but to enforce certain principles that I thought might advantageously be applied to the case. While I myself like neither ribs nor circles, I can conceive certain modifications might render them unobjectionable. That it is possible ever to get a perfect design to please everyone is a ridiculously Utopian dream. Certainly had the old masters waited for that we should have had no work from them.

The alterations that seem to me to be desirable are, firstly, that a greater prominence should be given to the gold ground, which should also be made to show conspicuously through the circles and the ribs. These would then be reduced from constructional features to pieces of graceful ornament forming a kind of network over the ground.

Secondly, that a return should be made to the rib treatment of Mr. Stevens's design, in which the bases of the ribs are virtually cut off from the peristyle, and the so-called architecture of the ribs is constantly interrupted. This seems, in some degree, achieved by Mr. Poynter.

Thirdly, it appears to me that it is also most important that any pictorial work should be confined to the lower portion of the dome. Both the designs fixed and those sketched seem to me to be most decidedly top-heavy, and the eye would, I think, gladly welcome in the upper part a considerable expanse of plain gold.

The upper part of the ribs would then disappear, the objection-

able sham constructiveness be got rid of, and the call for some vertical division still be satisfied. The rib would, in fact, be very much resolved into the tall graceful scrolls common in Byzantine work. Moreover, the only part where one could employ colour and design with any effect is towards the base, where the colour would be contrasted with the neutral tones of the drum, and cut off from the overpowering gold by a considerable use of white. It is understood, I believe, that the treatments of portions below the drum are merely experiments of Mr. Stannus, and not put forward as a scheme, otherwise they would be, of course, fair game for criticism.

I am, Sir, faithfully yours,

Guildford.

RALPH NEVILL, F.S.A.

#### Awards for Ventilators at the Health Exhibition.

SIR,—Seeing that Mr. Clark has not accepted our invitation to publish in your columns the letter which he says was sent to us inviting us to send our ventilator to be tested, or the one he states he received from us declining to comply, it can only be inferred that he is unable to substantiate his statements by the production of these letters. We have already affirmed that we were not invited to submit our air-pump ventilator, or any exhaust ventilator that we make, for the purpose of being tested, or that we declined to comply with such an invitation. This we adhere to, and no proof has been furnished, though specially invited, to show that we are in error. As to the mode of conducting and value of the experiments in question, your readers, from the mass of evidence which has now been submitted, will be able to form their own opinions.

Thanking you for the courtesy you have shown us in inserting our letters in your valuable columns,

We are, yours truly,

ROBERT BOYLE & SON.

64 Holborn Viaduct, November 29, 1884.

#### NOTES ON NOVELTIES.

**Jennings's Improved Water-Closet Apparatus.**—Anything emanating from the Stangate Works, Lambeth, is always looked upon with interest, owing to the reputation the late-much respected proprietor secured as a sanitary engineer. The latest introduction of which we are about to speak is a water-closet, urinal and slop-sink combined, and is named the "Pedestal Vase." The Health Exhibition introduced us to one of the finest collections of this class of goods ever brought together, and that of Mr. Jennings was by no means least amongst them. The new idea sought to be carried out in water-closets, of which this apparatus is an exponent, is that there shall be no wood or plaster work about the apartment whatever save the seat of the closet. It is suggested that the floor shall be tiled, or of mosaic work, and the walls *en suite*. The closet itself is a porcelain pedestal of ornamental shape on the "wash-out" principle, the lid (of wood) being hinged, and when lifted back, the vase forms a urinal or slop-sink. There is no doubt of the advisability of carrying out such a system from an hygienic standpoint, and we cannot see how any valid reason can be urged against it, except that it is too expensive for ordinary houses. But if the principle is admitted means will not be wanting to carry it out in a cheaper form. The ease with which an apartment so constructed can be cleansed must be apparent, and we have no crevices or chambers for the accumulation of dirt or diseased germs. All is open and visible to the eye, and the slightest inattention on the part of domestics must be detected. A noteworthy feature in the Pedestal Vase closet is that the body can assume a more natural position, thus securing greater comfort and convenience. But its greatest claim to favour is its superiority in discharging its contents every time it is flushed, and with only the orthodox two gallons of water. At the Health Exhibition it underwent a most crucial test at the hands of the jurors, presided over by Mr. Baldwin Latham, C.E., which is worth describing in detail. Ten apples (averaging 1½ inch in diameter) and a flat sponge about 4½ inches in diameter were thrown into the basin. The water as well as the whole of the dry surface was blackened with plumber's "smudge," and the sides covered with four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern (one of Jennings's syphons) was then pulled, and after the passage of the water (two gallons) through the vase, which was completed in seven seconds, the whole of the contents we have mentioned were carried away into the receiver, leaving no trace of soil or paper on any part. Even if the arrangements for tiling cannot be carried out in all houses, there is no reason why this closet should not be fixed, and, on the point of economy, it compares favourably with the lowest-priced closets that cannot claim such advantages. We understand they have already been fitted in several hospitals, hotels, &c., and it can only be a question of time for the adoption of this kind of closet to become general.

**Indiarubber Stamps.**—Few persons, we suspect, have any idea of the extent to which indiarubber stamps are now made use of in commercial pursuits, or the number of persons engaged in their manufacture. It is not merely the stamp

itself that labour is employed in, but the framework or press in which each of them is encased has to be taken into consideration, which forms no inconsiderable item in the cost of the appliance as a whole; and in looking at the manufactured article, we cannot but be struck at the moderate price at which these useful appendages to the office or warehouse can be now supplied. Our Government alone bring such a number into requisition year by year that a small manufacturer should be enabled to keep his works busy in supplying them, was he fortunate enough to secure the entire order. It is not surprising to find Birmingham in the "van" in the manufacture of these *bric-à-bracs*, and we may fairly single out Mr. A. Berkley, of Livery Street, in that town, as having been one of the most successful as well as one of the best makers. Leaving the indiarubber or stamp out of the question, there is probably no town in the kingdom so well adapted to manufacture the metal portion of the appliance, and there is little doubt that makers in other localities of the indiarubber stamp draw upon the "hardware village" for their fittings. Although the stamp itself is, after all, *par excellence* the important feature in the eyes of the user, if it is not accompanied by true and easy working mechanism and good ink, it would prove of little worth, and in each of these departments Mr. Berkley has scored a success. Architects, builders, and contractors are amongst the many who use indiarubber stamps to a large extent, and we can consistently recommend Mr. Berkley's stamp to the favourable notice of our readers.

## LEGAL.

### Supreme Court of Judicature.—Court of Appeal.

(Before Mr. JUSTICE HAWKINS and Mr. JUSTICE A. L. SMITH.)

#### FORMATION OF STREETS.

This was a case stated by Mr. Cooke, one of the Metropolitan Police Magistrates, for the opinion of the Court on questions of law which arose before him upon a summons taken out by the Metropolitan Board of Works against Messrs. Lathey Bros., builders, complaining that they had unlawfully formed or laid out a certain road, passage, or way, to wit, West End Avenue, Finchley Road, for building as a street, for the purposes of carriage traffic, of a less width than 40 feet, measuring 20 feet from the centre, contrary to the Metropolitan Management Acts, 1855 and 1862, and 41 and 42 Vic. c. 32, and by-laws.

The case was heard on April 4, 1884, when the Board's summons was dismissed, and against this decision the Board now appealed. Sir H. Giffard, Q.C., and Mr. Besley appeared for the appellants; Mr. Findlay, Q.C., and Mr. McColl for the respondents.

Mr. Besley, in opening the case, stated the respondents had built a house fronting on Finchley Road, and flanking on the above lane, without giving the statutory width; and the following questions of law had been reserved by the magistrate:—(1) Whether the respondents, having given notice to the district surveyor, the appellants were out of time in taking their proceedings? (2) Whether the respondents, by erecting a house fronting on Finchley Road, and flanking on to the lane in question, had committed the offence laid in the summons?

After hearing the arguments, the Court decided to dismiss the appeal on the ground that notice to the district surveyor was notice to the appellants, and that therefore they were not in time in taking their proceedings.

The other points were not dealt with.

## GENERAL.

**The Order of Leopold.**—The following artists have been nominated to the Belgian Order:—Commanders—M. Bossuet, painter; M. Clays, painter. Officer—M. Markelbach, painter. Chevaliers—MM. Ch. Brunin, sculptor; Carpentier, painter; Franz Courtens, painter; Felix Cogen, painter; Count Jacques de Lalaing, painter; and M. Serrure, architect.

**Mr. Gourlay Steell, R.S.A.**, has completed portraits of five of Her Majesty's favourite dogs. Some are executed in charcoal (which is fixed by the application of spray to the surface), and afterwards worked up in water-colours.

**Mr. Colin Hunter, A.R.A.**, has completed a picture of the Rapids above the Falls at Niagara, which will be exhibited next year at the Royal Academy.

**The Canadian National Portrait Gallery** has received thirty-two pictures from the South Kensington Art School, which are copies of works by the students.

**The Portrait of Jerome Holzschuler**, by Albert Dürer, which belonged to the Holzschuler family of Nuremberg, has been purchased for the Berlin Museum. The price paid for it was 1,250,000 frs.

**The Cambridge Fine Art Association** was inaugurated on Saturday with an exhibition of pictures, &c. The Society is intended to provide means of art culture in various branches, such as drawing, painting, engraving, etching, wood-carving, and art needlework. Equal facilities will be given to the academical student and the artisan.

**An Art Exhibition** with a fine collection of modern paintings and water-colours, and curious collections of all the reviews and papers which have been printed in Madrid since the Peninsular War, was opened in Madrid on Sunday.

**MM. Boussod-Valadon & Co.** will exhibit next week a collection of the works by M. Bougereau at their gallery, 116 and 117 New Bond Street. It will include *The Youth of Bacchus*, the work which was so nearly obtaining the medal in the Salon this year.

**The Central Hall** of the Corporation Galleries of Glasgow, which at present contains a collection of paintings lent by the Marquis of Bute, was illuminated with electric light for the first time on Saturday night.

**The King of Denmark** has offered a sum of 50,000 crowns (about 2,500*l.*) to the committee having charge of the decoration of the new Palace of Christiansbourg, which is to be reconstructed as soon as the necessary funds are voted by the Chambers.

**M. Bachmann** has been appointed Commissary-General of the Russian section of the Antwerp Exhibition in 1885.

**The Cecil Manuscripts**, which are preserved in Hatfield House, contain upwards of 30,000 documents, including State papers of various reigns, from Richard I., numerous illuminated MSS., theological treatises, rolls of genealogy, plans, charts, and voluminous correspondence between personages, some of them the most illustrious in English history.

**A Collection of Historical Documents** has been discovered under a beam in the triforium on the north-west side of the choir of Carlisle Cathedral. The papers are supposed to have been concealed prior to the siege of Carlisle under Leslie in 1645.

**The Mayor of Shrewsbury** has suggested that an exhibition of pictures and other works of art should be held in the old school buildings before they are opened for a museum and free library.

**A Mosaic** which has been placed in front of St. Jude's Church, Whitechapel, in recognition of the efforts made by the rector to hold art exhibitions in the East End, was unveiled on Saturday. It is a copy of Mr. Watts's *Time, Death, and Judgment*, and has been executed by Messrs. Salviati, Burke & Co.

**A New Church** is shortly to be built at Netley, upon a piece of ground overlooking the ruined Abbey, given by Colonel Crichton. Mr. Sedding is the architect.

**Mr. Arthur Ramsden** has been appointed surveyor to the Chiswick Local Board in succession to Mr. Strachan, who has accepted the Chelsea surveyorship.

**Mr. Ruskin** lectured on Saturday afternoon in the theatre of the University Museum at Oxford on birds. To prevent the overcrowding and crushing which have taken place at his previous lectures, Mr. Ruskin has issued instructions that in future only his pupils will have the privilege of bringing a friend.

**The Restoration** of the nave and nave aisles of All Saints Church, Maidstone, is to be proceeded with under Mr. Pearson, R.A. Some local builders and two or three London contractors are to tender for the work.

**A Music Room and Offices** are to be erected in the grounds of St. Mary's Cathedral, Edinburgh.

**Upleatham Church**, Yorkshire, is about to be re-seated and restored. The work has been entrusted to Messrs. Clark & Moscrop, architects, Darlington.

**A Maritime Canal** is to be constructed between Nantes and the Bay of Biscay. The cost is estimated at five millions of francs. The funds have been voted by the Council-General of the department.

**The Burgh Engineer** of Edinburgh recently examined 205 cisterns in the city. It was found that 89 were clean, 104 dirty, and 12 very dirty; 16 were provided with covers, 122 were without covers, and 7 were partially covered; 111 cistern waste-pipes discharged directly into the soil-pipe, 15 into the sink soil-pipe, and 6 into sinks; 29 were above the seal of water-closet traps, 11 discharged into roof-pipes, and only 24 discharged to the open air. In one case the drain gases were perceptibly escaping into the cistern.

**The Committee** for erecting the new church of St. Augustine, Highgate, have placed the work in the hands of Mr. John D. Sedding.

**An Anonymous Donor** has offered to give 15,000*l.* towards the rebuilding of the parish church of Portsea, if by next August a certificate is given him that an equal sum will be forthcoming by September 31, 1887. The cost of the work apart from the tower is estimated at about 30,000*l.*

**The Mersey Tunnel** was practically completed on Saturday last, as the last length of brickwork, 2 feet 6 inches in thickness, was laid. The permanent way has to be yet laid down. The tunnel runs from opposite the cathedral, in Church Street, Liverpool, to a point under Hamilton Street, Birkenhead, a distance of over two miles and a half, including the river tunnel.

**The Inhabitants of Harrow** are taking active steps to preserve Harrow Weald Common, its existence as an open space being threatened by the Highway Board, who are desirous of selling it for building purposes.

**Messrs. C. Isler & Co.** completed last week for some cement works at Grays, in Essex, an artesian bored tube well, 140 feet deep, and 7½ inches in diameter, yielding a supply of 9,000 gallons per hour through a pulsometer pump.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, DECEMBER 6, 1884.

### APPOINTMENTS VACANT.

**BEDWELTY.**—Dec. 10.—Applications are Invited for the Office of Surveyor. Mr. J. A. Shepard, Tredegar, Mon.

**HANLEY.**—Dec. 10.—The School Board are Desirous of Appointing an Architect to the Board. Mr. Alfred Smith, Clerk to the School Board, Hanley.

**HORSHAM.**—Dec. 11.—Applications are Invited for the Appointment of County Surveyor for the Western Division of Sussex. Mr. T. Bedford, Clerk to the Highways Committee, Horsham.

### COMPETITIONS OPEN.

**FALMOUTH.**—Dec. 24.—Plans are required for the Erection of Wesleyan Sunday School Premises, with Class-rooms, &c. Mr. F. L. Earle, Falmouth.

**KING'S NORTON.**—Jan. 15.—Plans for the Erection of Four Cottage Homes upon Lands situate at Shenley Fields are required. Mr. Ralph Docker, Clerk of King's Norton Union, Colmore Row, Birmingham.

**KING'S NORTON.**—Jan. 15.—Plans are invited for the Erection of a Laundry, at the Workhouse, Selly Oak. Mr. Ralph Docker, 57 Colmore Row, Birmingham.

**VENTNOR.**—Dec. 8.—Designs are invited for the Construction of an Iron Promenade Pier and Landing Stage. Mr. R. S. Scott, C.E., Surveyor to the Local Board, Ventnor, Isle of Wight.

### CONTRACTS OPEN.

**ABERLOUR.**—Dec. 9.—For Building Villa and Stable. Messrs. A. & W. Reid, Architects, Elgin.

**ABERSYCHYN.**—Dec. 10.—For Erection of Police Buildings. Messrs. James Seward & Thomas, Architects, St. John's Chambers, Cardiff.

**ADDINGTON.**—Dec. 11.—For Execution of Well-Sinking and Pumping Works. The Borough Engineer, 8 Katherine Street, Croydon.

**BALROTHERY.**—Dec. 8.—For Building Six Labourers' Cottages. Mr. James Stack, Board Room, Lusk, Co. Dublin.

**BELFAST.**—Dec. 9.—For Apartments at Infirmary. Mr. W. F. Boyce, Clerk to the Union, Workhouse, Belfast.

**BELFAST.**—Dec. 18.—For Heating Post Office. Mr. W. B. Soady, Secretary, Office of Public Works, Dublin.

**BETTSYCORD.**—Dec. 9.—For Additions to Glanaber Hotel. Mr. Richard Davies, Architect, Bangor.

**BELFAST.**—Dec. 15.—For Building Goods Shed, Donagall Quay. Mr. W. Currie, Harbour Office, Belfast.

**BIRKENHEAD.**—Dec. 11.—For Additions to late Oxtan Local Board Offices. Mr. T. C. Thorburn, C.E., Hamilton Square, Birkenhead.

**BLACKBURN.**—Dec. 8.—For Building Goods Offices, Extension of Stables, &c., Mill Hill. The Engineer's Office, Hunt's Bank, Manchester.

**BURNLEY.**—Dec. 10.—For Supplying Cast-iron Pipes. Mr. E. Filliter, C.E., 16 East Parade, Leeds.

**COVENTRY.**—Dec. 10.—For some Alterations at the Workhouse Hospital. Mr. W. W. Harris, Clerk to the Guardians, Coventry.

**DARLSTON.**—Dec. 18.—For Construction of Ten Miles or thereabouts of 18-inch, 15-inch, 12-inch, 10-inch, and 9-inch Earthenware and Cast-iron Pipe Sewers, and Construction of Engine and Boiler-house, Cottage, Tanks, Filter-beds, Drains, &c. Mr. Edward Pritchard, C.E., 2 Storey's Gate, Westminster, or 37 Waterloo Street, Birmingham.

**DURBAN.**—Dec. 15.—For Supply of Cast-iron Water Pipes (1,000 tons), &c. South African Mercantile Agency, 9 King William Street, E.C.

**DURHAM.**—For Building Church at Dipton. Messrs. Oliver & Leeson, Architects, Bank Chambers, Mosley Street, Newcastle-on-Tyne.

**ELY.**—For Building House. Mr. Walter Robinson, Architect, Forehill, Ely.

**FORDINGBRIDGE.**—Dec. 9.—For Building Lodge, Coach-house and Stabling. Mr. Fred Bath, Architect, 312 Strand, W.C.

**GRAVESEND.**—For Building Small House. Mr. A. G. Smith, Architect, 1 Darnley Street, Gravesend.

**HERTFORD.**—Dec. 19.—For Alterations to Assize Courts Shire Hall. Mr. Urban A. Smith, County Surveyor, Hertford.

**KENDAL.**—Dec. 10.—For Alterations to Wool Store. Mr. Stephen Shaw, Architect, Kendal.

**KINGSTHORPE.**—Dec. 8.—For Construction of One Mile of Brick Sewer with Manholes, &c. Mr. Wm. Hull, Architect, 12 St. Giles's Street, Northampton.

**KING'S NORTON.**—Dec. 16.—For Laying Sewers, King's Heath and Greenhill. Mr. Robert Godfrey, Surveyor, King's Heath.

**LONDON.**—Dec. 10.—For Completion of Infirmary, Harrow Road. Messrs. A. & C. Harston, Architects, 15 Leadenhall Street, E.C.

**LEEDS.**—Dec. 16.—For Building Warehouse. Mr. Wm. Bakewell, Architect, 38 Park Square, Leeds.

**NORHAM.**—Dec. 15.—For the Supply and Erection of a Wrought-iron Bridge over the River Tweed. Mr. H. F. Sneyd-Kynnersley, Surveyor's Office, Moot Hall, Newcastle-on-Tyne.

**NEWCASTLE-ON-TYNE.**—Dec. 15.—For Constructing and Fitting-up Public Baths and Washhouses. Messrs. Gibson & Allan, Architects, 3 St. Nicholas' Buildings, Newcastle-on-Tyne.

**NEWRY.**—Dec. 10.—For Excavating Channel between Newry River and Carlingford Lough. Mr. J. Barton, C.E., Exchange Buildings, Dundalk.

**OPORTO.**—Dec. 15.—For Construction of Covered Market. Senor J. A. Correa de Barros, President of the Municipal Board of Oporto, Portugal.

**PORTSMOUTH.**—Dec. 13.—For Building Inland Revenue Office. H.M. Office of Works, 12 Whitehall Place, S.W.

**RYDAL.**—Dec. 6.—For Chancel to Church. Mr. Robert Walker, Architect, Windermere.

**SOUTHAMPTON.**—Dec. 15.—For Building Infant School, &c., and Additions to York Buildings Board School. Mr. E. T. Howell, Architect, 6 Portland Street, Southampton.

**SPITFAT.**—Dec. 8.—For Building Dwelling-house on Farm. Mr. Williams Brims, Architect, Wick.

**YORK.**—Dec. 22.—For the Construction of Flood Banks, Subsiding Reservoir, Filter Beds, &c., at Pumping Station, near Acomb Landing. Mr. C. Hornsey, Engineer, 16 Railway Street, York.

### TENDERS.

#### AUDENSHAW.

For Sewering and Draining Nelson Street, Audenshaw. Mr. J. BURTON, Surveyor, Warrington Street, Ashton-under-Lyne.

JONES & HILTON, Hooley Hill (accepted per schedule of prices).

Six Tenders were received.

#### BALBRIGGAN.

For Construction of Main Sewer (800 feet), Chapel Lane, Balbriggan, Balrothery.

Martley	£98	0	0
Percival	93	0	0
HEENERY (accepted)	75	0	0

#### BIRMINGHAM.

For Extension of Railway Viaduct for the Birmingham Gas Committee.

Piggott & Co. (accepted) £6,470 0 0

For Desks, Counters, and Fittings for the Large Office, Fittings for Strong Rooms, and Lift for Fitting Show-room, at Gas Offices, Birmingham.

BARNLEY & SONS (accepted) £1,736 10 0

Electric Bells.

SADLER (accepted) £5 15 0

#### BUCKIE.

For Erection of Part of Block of Buildings, at Nether Buckie, for Sir R. Glendourwyn Gordon, Bart. Messrs. BRUCE & SUTHERLAND, Architects, Buckie, N.B.

Milne, mason	£479	10	0
Mitchell, carpenter	440	0	0
G. & W. Sutherland, plasterer	112	0	0
Rathie, plumber	65	15	0
Barclay, slater	57	9	0

#### CHAGFORD.

For Dwelling-house and Offices at Chagford, for Mr. A. H. Unwin. Messrs. J. W. ROWELL & SON, Architects, Newton Abbot and Torquay.

Gooding, Exeter	£2,480	0	0
Holmes, Exeter	2,230	0	0
Gibson, Exeter	2,050	0	0
Stone, Chagford	1,680	0	0
Aggett & Underhill, Chagford	1,666	0	0
Collins & Ellis, Chagford	1,558	0	0
BRIMBLECOMBE & ELLIS, Chagford (accepted)	1,551	0	0
Bresley, Torquay	1,410	0	0

PRIMROSE & CO.  
CHURCH ST.  
SHEFFIELD.

ECLIPSE PATENT  
ROOF GLAZING

NO PUTTY, PAINT,  
ZINC OR OTHER  
PERISHABLE MATERIAL.

IN EXTENSIVE USE FOR RAILWAY STATIONS, MILLS, &c.

NO OTHER GLAZING CAN BE WARRANTED INDESTRUCTIBLE.

PRIZE MEDAL AWARDS: KENSINGTON, MANCHESTER, LIVERPOOL, DONCASTER 1882-3.

THE ONLY GLAZING AWARD. INTERNATIONAL HEALTH EXHIBITION, 1884.

**CANTERBURY.**

For Construction of the Elham Valley Railway.  
Walker & Sons . . . . . £1,200,000 0 0

**CARLOW.**

For Town Hall and Market Place, Carlow. Mr. Wm. HAGUE, Architect, Dublin. Quantities by Mr. Fredk. Morley, Commercial Buildings, Dublin.

Nolan, Monahan . . . . .	£3,740 0 0
Pemberton & Son, Dublin . . . . .	3,303 0 0
Dodd, Beckett & Co., Dublin . . . . .	3,220 0 0
Brady, Bray . . . . .	3,168 3 0
T. & J. Pemberton, Dublin . . . . .	2,898 0 0
Crampton, Dublin . . . . .	2,853 0 0
Tighe & Son, Dublin . . . . .	2,790 0 0
Redmond, Wexford . . . . .	2,681 8 9
Carbury, Athy . . . . .	2,550 0 0
Robinson, Carlow . . . . .	2,488 0 0
CONNOLLY & SON, Dublin (accepted) . . . . .	2,327 0 0
Breslin Bros., Dublin . . . . .	2,300 0 0

**DENHOLME CLOUGH.**

For Alterations to Chapel, Denholme Clough. Mr. HERBERT HODGSON, Architect, Queensbury. Quantities by the Architect.

*Accepted Tenders.*

Hird, carpenter and joiner . . . . .	} £213 11 7
Charnock, plasterer . . . . .	
Stocks, plumber . . . . .	
Hodgson, painter . . . . .	

**DERBY.**

For Erection of Wesleyan Chapel, Ashbourne Road, Derby. Mr. JOHN WILLS, Architect, Derby. Quantities by Mr. Robey E. Carpenter, Horninglow Street, Burton-on-Trent.

Fletcher . . . . .	£4,504 0 0
Wood . . . . .	3,900 0 0
Porter . . . . .	3,960 0 0
Bakewell . . . . .	3,850 0 0
Wood . . . . .	3,831 0 0
WALKER & SLATER (accepted) . . . . .	3,595 0 0

**DUDLEY.**

For Gas-piping and Fittings at Workhouse School, Dudley. Gas Company, Dudley . . . . . £160 0 0  
Guest, Dudley . . . . . 160 0 0  
Fryer, Dudley . . . . . 139 0 0  
WORRAL, Wolverhampton (accepted) . . . . . 110 0 0

**FRODSHAM.**

For Erection of Wesleyan Chapel, Five Crosses, Frodsham. Mr. JOHN WILLS, Architect, Derby. Quantities by Mr. Robey E. Carpenter, Horninglow Street, Burton-on-Trent.

LITTLE (accepted) . . . . . £1,400 0 0

**GREENWICH.**

For Constructing Wrought-iron Girder Bridge over the River Ravensbourne, opposite Albion Street, Cold Bath, Greenwich.

APPLEBY BROS. (accepted) . . . . . £1,790 0 0

For Paving in Hatfield Street, Deptford. WOODHAMS & FRV (accepted) . . . . . £258 0 0

For Gas and Hot-water Fittings for new Buildings at Workhouse, Greenwich.

Gretton & Co., London . . . . .	£660 0 0
Holloway, London . . . . .	607 0 0
Mott, Deptford . . . . .	601 9 10
Stidder & Co., London . . . . .	525 0 0
May, London . . . . .	510 0 0
Godfree, London . . . . .	505 11 0
Parr, Deptford . . . . .	489 13 0
Strode, London . . . . .	465 0 0
Cannon, London . . . . .	439 0 0
Rosser, London . . . . .	422 9 0
Pennycook & Co., London . . . . .	404 10 0
Wright, London . . . . .	397 8 0
Thompson, Rawdon, near Leeds . . . . .	364 8 10

**HARROW.**

For Alterations and Additions at Green Hill Farm, Harrow. Mr. E. TYLER, Architect. Quantities by Mr. W. Barnett.

Rider & Son . . . . .	£2,900 0 0
Stimpson & Co. . . . .	2,886 0 0
Chappell . . . . .	2,860 0 0
Laurance . . . . .	2,792 0 0
Richardson . . . . .	2,659 0 0
Shurmur . . . . .	2,484 0 0

**HUDDERSFIELD.**

For Building Junior Department at the Oakes Schools, Lindley, for the Huddersfield School Board. Mr. B. BROOKS, Architect, Huddersfield. Quantities by the Architect.

Bates, Lindley, mason . . . . .	£1,985 0 0
Stott, Lindley, joiner . . . . .	1,088 0 0
Garton, Huddersfield, plumber . . . . .	448 15 0
Pickles Bros., Huddersfield, slater . . . . .	289 18 0
Royston & Noble, Lindley, plasterer . . . . .	109 10 0
Earnshaw Bros., Lindley, painter . . . . .	63 0 0
Heaps & Co., Huddersfield, heating . . . . .	399 15 0

Total . . . . . £4,383 18 0

**LOFTUS.**

For Portion of Third Section of Main Outfall Sewer, Loftus. Mr. C. A. COPLAND, Surveyor.

Collins, Loftus . . . . .	£261 12 6
Gladstone, Brothton . . . . .	245 16 6
France, Middlesbrough . . . . .	197 10 0
Walker & Dickinson, Saltburn . . . . .	190 7 0
HERBERT & MOORE, East Loftus (accepted) . . . . .	183 0 0

**LONDON.**

For Pewterers' Work at the Royal Standard, York Road, Battersea, for Messrs. Sansom & Ewington. Mr. H. I. NEWTON, Architect, 17 Queen Anne's Gate.

Heath . . . . .	£133 0 0
Davidson . . . . .	125 10 0
KEMBLE (accepted) . . . . .	117 0 0

For Alterations to the Ranelagh Arms, Old Ford Road, for Mr. N. Argent. Mr. EDWD. BROWN, Surveyor, Hanbury Street, Spitalfields.

Salt . . . . .	£495 0 0

GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

TESTIMONIALS.  
"9 Victoria Chambers, Westminster, S.W."  
"June 10, 1884."  
"SIR,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it."  
"Yours, &c."  
"JAMES WEIR, F.R.I.B.A."

"To Mr. Grundy."  
"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square."  
"February 15, 1884."  
"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.  
"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools in  
course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public."  
"Mr. John Grundy."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City  
Road, London.

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under plates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

**BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION** for coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent. more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh, and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use.

A horizontal boiler, 17 ft. 6 in. long, 15 H.P., gave the following results:—

Temperature on Plates .. .. .	186 deg.
"          Covering .. .. .	94 "

One ton of coal was saved per week, and, although the fire was raked out every evening 29 lbs. of steam were in the boiler next morning.

The following testimonial refers to this covering:—

Dear Sir,—It may interest you to know that we have exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

**BELL'S ASBESTOS PAINT**, for floors, stairs, and all interior woodwork, to prevent the spread of fire. This paint is especially useful in cotton mills, and in fact in all factories and buildings exposed to risk from fire. It is quite free from poisonous ingredients, and is both easily and cheaply applied. Bell's Asbestos Paint has, on several occasions, done great service in preventing the loss of life and property. The great fire in Buchanan Street, Glasgow, in November last, produced the following testimony to the value of this material:—

Offices of the Glasgow Herald, the Weekly Herald, and the Evening Times,

Mr. John Bell, Glasgow, Nov. 14th, 1883.  
Sir,—As one of the means that helped to save our buildings extending from Buchanan Street to Mitchell Street from the recent great fire, I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the Evening Times case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of the Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood, thrice coated with Irish Lime, at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

**BELL'S ASBESTOS SASH-LINE CORD** is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire escapes.

## BELL'S ASBESTOS.

The goods of this house are of the highest quality only, and no attempt is made to compete with other Manufacturers by the supply of inferior materials at low prices. All orders must be sent direct to the undermentioned depots, and not through agents or factors.

**BELL'S ASBESTOS AND INDIA-RUBBER WOVEN TAPE AND SHEETING** for making every class of steam and water joint. It can be bent by hand to the form required, without puckering, and is especially useful in making joints of manhole and mudhole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 feet, from 1-in. to 3-in. wide, and any thickness from  $\frac{1}{8}$  in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears the trade mark, without which none is genuine. It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at my price, users are recommended to see that every 10-ft. length of the Asbestos Tape purchased by them bears the trade mark.

**BELL'S ASBESTOS CEMENT** for the backing of firebricks and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firebricks and kitchen ranges of private houses. Any labourer accustomed to handle other cements can apply this.

**BELL'S ASBESTOS BOILER PRESERVATIVE.**—This useful mixture, by absorbing the free oxygen that is in the water, entirely checks pitting and corrosion. It also disintegrates incrustation so immediately as to prevent its adhering to the plates. Not only is a great economy of fuel effected by keeping boilers clean, but the risk of having the plates burned is thereby obviated. It has been computed that 1-16th inch thick of incrustation causes a waste of 15 per cent. of coal;  $\frac{1}{8}$  inch thick, 60 per cent.; and  $\frac{1}{4}$  inch, 150 per cent. Thus the Preservative avoids the great risks which are inseparable from scaled plates, lengthens the life of a boiler, and covers its own cost a hundredfold by economy of fuel. It is entirely harmless, and has no injurious action on metals. It can be put into the feed tank or boiler, as may be most convenient. Sold in drums and casks bearing the trade mark, without which none is genuine.

**BELL'S PURE ASBESTOS CLOTH**, for protection against the spread of fire. Iron curtains warp, and in the great emergency of fire will often be immovable. Asbestos cloth, being incombustible, will remain strong and flexible for an indefinite period, and will stay the progress of a fire and the passage of smoke longer than any other known material. This cloth is also extensively used in Maignen's unequalled water filters, for which a gold medal and diploma of honour were awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

**BELL'S ASBESTOS BLOCK GAS FIRES.**—The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas burner, is fixed at the bottom of the block. After being lighted a short time, both the block and asbestos fuel throw out intense heat.

**BELL'S ASBESTOS FUEL** for gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

**BELL'S SPECIAL LONDON-MADE ASBESTOS MILLBOARD**, for dry steam joints, made of the best Asbestos fibre, is well-known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and  $\frac{1}{2}$  millimetre to 25 millimetres thick. Each sheet bears the Trade Mark.

# The Architect.

## AN IMPROVEMENT IN THE LAW OF ANCIENT LIGHTS.

It is quite unnecessary to remind the readers of an architectural journal that the administration of the law of easements of light is a question which is constantly pressing hard upon all those who are concerned in building operations in large towns, and especially, of course, in the metropolis. Any new doctrine, therefore, which makes its appearance in the practice of the Courts of Law becomes an important subject for the consideration of architects. How it is that such new doctrines arise and acquire force it

may not be easy for outsiders to discover technically; but, speaking broadly, what seems to take place is that the principles of liberal common sense in this, as in other matters, gain ground by slow steps on every hand against the prejudices in favour of the conservation of privilege which have so strong a hold upon English law, and that occasionally this gradual progress advances by a perceptible jump. Accordingly, architects will be glad to know that in the Courts of the Chancery Division there appears to be just now a decided inclination to avoid the issue of injunctions for stopping the progress of their buildings, and to decree that money damages shall be accepted instead. We need scarcely observe that every advance in this direction will be welcomed by the architectural profession with the utmost satisfaction.

The law of ancient lights, as so many architects know to their cost, goes primarily to this; that an old window shall not have its means of lighting interfered with by a new building. In language a little more technical, when a window has for twenty years had an easement of light over a neighbouring property, the owner of that neighbouring property shall not build upon it to any such extent as to interfere with the easement. It is nothing that this privilege of receiving light has been acquired without purchase or permission of any kind; it is enough to show that it has been enjoyed for twenty years, in order to evoke all the terrors of the law for its perpetual protection; and, so far, cost what it may to the neighbouring proprietor, either in inconvenience or in loss of profit, the dog in the manger who owns the old window—perhaps a very trumpety old window after all—may defy him to add one cubit to the stature of his house, or, theoretically, even to put a pot upon his chimney. The obvious absurdity to which this principle of conservatism may be so readily pushed has always been acknowledged, and a certain vague relief has been devised in the introduction of the idea that immaterial or unsubstantial damage, although in theory it may be tangible enough as a legal grievance, cannot in practice be considered worthy of the serious attention of the Court; and a plaintiff has therefore been required to show that the obstruction of his ancient light is a “material” interference with the beneficial use of his premises. This is apparently a great gain in the direction of common sense; but, inasmuch as the phrase “material” cannot be fixed to any definite meaning, the recognition of the grievance comes to be a matter of opinion after all, so that when plaintiff and defendant have thoroughly agreed upon the facts, it is still contended by the one that the result is material and by the other that it is not, so that the judge must determine between them as he best can. Scientifically regarded, this is most unsatisfactory; and we may add, as the universal opinion of the building community, that architecturally it is ruinous. In carrying out, that is to say, the absolutely necessary improvement of house property in English towns, no architect can discover by any means where he ought to stop in enlarging the bulk of his building; or, in plain words, at what point he may expect to be safe against the attempts of neighbours to levy black mail upon his client, on the pretence of protecting ancient lights, by applying to the Court for injunctions to mutilate the building. It has to be explained, further, that the only deterrent influence which comes in aid of the defence is the risk, seldom a serious one, of a plaintiff having law costs to

pay if he fails in his suit; whilst, on the other hand, the chance of mutilation to the new building has attached to it the sometimes greater hazard of the defendant having to pay the costs of any number of assaults that may happen to be delivered against him upon speculation. Of the buying off of injunctions nothing need be said but *Vae victis!*

We may take leave to understand that in all cases the tendency of reform in litigation is in the direction of an escape from the hardships which naturally arise out of the undue application of abstract principles of right. In cases of equity more particularly, good sense may be said to be more and more modifying the operation of rule. Therefore, when we have to do with a principle so extremely exacting as the elementary idea of the protection of ancient lights—their maintenance in identity *coute que coute*—it can only be a question of time in these days when the vital energy of progress shall overcome the *vis inertiae* of conservation; and the form which this victory must necessarily take seems to be the substitution of some kind of compensation for the prohibitive injunction. There are two ways in which this may be done. On the one hand, the value of the easement may be restored by some convenient alteration of the old window; on the other hand, an equivalent may be awarded by way of recompense for loss. In either case, of course, a court of law will make it a matter of what is called money damages.

By a statute known as Lord CAIRNS'S Act, of no very old date, it was enacted that in a case of this kind the judge should have a discretionary power to award money damages instead of granting an injunction, provided he felt satisfied, first, that an injunction ought in strict equity to issue; and, secondly, that if issued it would do more harm on one side than good on the other. This Act has been repealed in adjusting the still more recent changes which have been made in the system of litigation, but another enactment takes its place which has so far the same effect; and it is under this new statute that the Court seems now to see its way to go much farther than hitherto in the refusal of oppressive injunctions to restrain building. Within the present week Mr. Justice PEARSON—to whose Court these cases seem now to be chiefly allotted—has given a decision in this direction for which every architect in the kingdom will thank him heartily. We may simply say that the case is one in which a lofty house is being built in the well-known thoroughfare of Jermyn Street, and that the attempt of an opposite shopkeeper to cut down the front to something like the old low level has been, after very careful consideration, defeated on the principle we have referred to, an injunction being refused and money damages awarded. The evidence given by Professor KERR for the defence seems worth quoting: the appreciable extent of the injury, he said, no one could deny; and, although the plaintiff would practically never be a penny the worse, he ought to receive, in accordance with custom, a moderate money compensation—“to buy him off,” as the judge said, by way of helping the witness to explain himself. How many cases there have been in which the plaintiff would practically suffer no loss, and has yet been able to prohibit the erection of his neighbour's building, it is not necessary to say. And how many cases there have been in which the prohibition thus obtained has been, to speak plainly, *sold* by the plaintiff at an exorbitant price, it might be still more undesirable to suggest.

There can be no doubt that this amelioration of the rigour of the law—for the too well-known Prescription Act is still in force—will steadily advance, until that terror of architects, the “light and air case,” will practically almost always take the form of an amicable reference to one or more architects to assess the money value of an acknowledged damage. One of the next steps may already be the discovery of a principle upon which a plaintiff whose money damages do not happen to run up very high may be left by the Court to pay his own costs, or possibly, if the cards be played well against him, the costs of the defendant as well—which would be a shocking misadventure.

Those architects who have been agitating of late years for a change in the law of ancient lights may now see the force of what was pointed out to them when they first started on their enterprise, namely, that the improvement of the practice of the Courts is the only form which such a change can really take. To obtain a repeal of the Prescription Act, anyone experienced in the matter can see is virtually impossible, even in principle; but to put a reasonable construction upon it is easy, and to do so must chiefly be the work of architects in the

witness-box. It ought to be borne in mind that professional union in the cause of liberal good-sense is one of the most powerful influences exhibited in modern society. The profession of architects may not have done so much in this way during the last few years, but the time is within the memory of many when, under such leaders as Professor DONALDSON and Sir WILLIAM TITE, a good deal used to be done. In the matter now under review, we have no doubt that a little intelligent co-operation might speedily effect all that the reformers desire, and we may congratulate them upon the practical sympathy of Mr. Justice PEARSON.

### ALAS, POOR STEVENS!

BY LEWIS F. DAY.

THE question of the decoration of St. Paul's has been discussed at some length, if to little purpose, at the Institute; but it can scarcely be said that ALFRED STEVENS's design was subjected to discussion. Generally speaking, it was ignored by the gentlemen who favoured the meeting with their schemes. Occasionally it was referred to, only to be contemptuously dismissed, the one full-fledged Academician who took part in the discussion expressing his hope, in terms almost identical with those of the judge who condemns a capital offender, that the objectionable design might be removed to the obscurity from whence it came, &c. &c.

Mr. AITCHISON, alone amidst Fellows and Associates, spoke with the appreciation of STEVENS which one might have expected from him. It was he also who pointed out that if the services of artists of the calibre of Sir FREDERICK LEIGHTON and Mr. POYNTER are to be obtained, they will have to be consulted as to what shall be done, and their judgment allowed to rule. The solitary member of the Decoration Committee present on the occasion of the adjourned discussion spoke indeed in favour of STEVENS, but his purpose in so doing soon became apparent. He raised him for a moment upon a pedestal only that he might the more easily knock him down—a device not altogether unfamiliar in Parliamentary speech-making. But the opinion of the hon. member is not likely to be taken very seriously by anyone. He himself confessed to the meeting that he was not a man of taste, and, what is more, he did not believe in taste. What was it? It was only a matter of opinion after all. And yet Mr. CAVENDISH BENTINCK is a member of the Decoration Committee, and has power to pooh-pooh an ALFRED STEVENS.

It was curious to observe how the "discussion" resolved itself into an exposition of the rival schemes of the various speakers. There was a general eagerness to show how much better the speaker could have done if the doing had been left to him. One or two had even the temerity to put their schemes on paper, and submit them to the judgment of the meeting. They were pretty much what one might have expected from men who dared to rush into competition with STEVENS. That they were hastily prepared does not excuse them. STEVENS's own design remains quite in the rough. And a fortnight, or ten minutes for that matter, is enough to show whether one has a notion of design or a sense of colour. What would BOTTICELLI have said of the design done after him?

Those who confined themselves to words were wiser in their generation. One may rhapsodise about cherubim and seraphim, and all the hosts of heaven, without much harm. The hearer is carried away by the vision that is called up, or smiles to himself, according to the manner of man he is. The human mind is satisfied with the vaguest of pictures, and it is quite possible to think of the glory of heaven without seeing how that idea is to be embodied in the decoration of a dome. Needless to say that it is far easier to indulge in quasi-poetic descriptions as to what the vault should contain than to show how the angelic hierarchies are to be designed, except in zones, which detract from the apparent height of a dome, or in such picturesque confusion as probably no architect would advocate.

There was some indication in the discussion of the difficulty which besets the question of the decoration of our metropolitan cathedral in the divergence of religious opinion existing within the body of the English Church. There is no possible scheme of figure decoration which would satisfy alike those members of the Church of England who call themselves Catholics and

those who glory in the title of Protestant. That is a fact which might be brought forward as an argument against the introduction of figure work in any shape into the decoration of St. Paul's.

The other objection, urged with some show of reason by more than one speaker—viz. that the scale to which it would be necessary to enlarge the figures in order that they should be seen would be quite out of proportion with the architecture—is not so serious as may at first appear. It is true that the eye is accustomed to due dimensions of the human figure, and, more or less unconsciously, uses it as a standard. But it is not *only* the human figure with which the eye is familiar and by which it unconsciously makes its measurement. We are equally accustomed to a certain scale in the more ornamental details of mouldings, capitals, and so on. An immense acanthus leaf would, as certainly as a gigantic human figure, to some extent lead astray the beholder's estimate of the actual size of the vault. The very features of the building do this. How many of the sightseers who look up into the dome of St. Paul's have any conception of the magnitude of the windows beneath it? They are so accustomed to windows of much smaller area that they can with difficulty be brought to believe that these are so many times larger than they look to them; and yet, for all that, the dome itself appears vast enough for one and all. It is easy to say that this or that would destroy its vastness, but I doubt it would be very difficult actually to do that; and, indeed, a certain difference between the scale of the details of distant decoration and the size they would appear if represented strictly according to natural proportions adds probably to that mystery of effect which constitutes the poetry of architecture. We are somewhat over-prosaic in our demands in this respect.

It was quite in keeping with the tone of the debate that STEVENS's model should, on the occasion of the discussion, have been shifted from the place it occupied on the night of Mr. STANNUS's paper to the opposite corner of the room, where the backs of the assembly were turned to it throughout the evening. With a solitary exception no one, it seems, wanted to refer to it. Yet Mr. STEVENS's model was the one attractive feature of the meeting.

We have had before us for some time now Mr. POYNTER's idea of STEVENS, and Mr. STANNUS's idea of STEVENS, and it was high time that we had before us at last STEVENS's version of STEVENS. Truly they have kept the good wine till the last! Whatever one's prejudices one must admit that it is a grand design. If the artist had lived to carry it out (supposing for a moment that the powers that be would ever have permitted the execution of anything worth executing) we should have had a work of decoration, not perhaps by any means free from fault (was ever anything above mediocrity faultless?), but certainly worth having—a grander work than has been done, or is likely to be done, in our generation.

The meeting at the Institute was a most depressing experience. We were told, with all the characteristic and patriotic fervour of an after-dinner speech, that WREN was the greatest genius that ever lived. There was something to be said even for Sir JAMES THORNHILL; but STEVENS was worthy only to be scolded, or at best to be ignored. Alas, poor STEVENS! Poor anyone who is concerned in our day in any such scheme as the decoration of St. Paul's! Think of the conditions under which he needs must work! In the multitude of counsellors there is, proverbially, wisdom; but the multitude of cooks do not, according to the proverb, assure good broth. In the present instance the cooks are not all artists, and there is every chance of their dishing up a hash, harmless perhaps but flavourless—and, well, *not* equal to the famous *fricassée* of CORREGGIO.

The conditions under which a modern work of any magnitude is undertaken are not such as are likely to result in anything like a great work. Inspired by a committee of taste (and we may take it that the taste of a committee even the most select, must be of the "composite" order), overshadowed if not overawed by the authority of a Royal Institute, criticised on the one side by architects and on the other by painters, and barked at by the press all round, is it possible, not to say likely, that a man will give us the best that is in him to do?

The kind of man who will submit himself, lowly and reverently, to the dictation of a committee, is the kind of man to whom a great work should on no account be entrusted. We may all have our notions as to what is the best way of decorating the dome of St. Paul's, and we may be right or

wrong. But different as our notions may be, we ought all to be able to recognise this : that it must be the idea of the man who is to do the work that must prevail. Every great artist succeeds in showing us that what we thought wrong is right enough *as he does it*. The design of ALFRED STEVENS offends many of my own private prejudices, but I am more than content to take it on its merits as the only attempted solution of the difficulty that is in the least adequate to the occasion. Let those who can produce something better throw stones if they like. It appears there are plenty such ; but they are an unknown quantity. There is significance in the circumstance that such men as Mr. CLAYTON, who was present the other night, did not take part in the discussion.

Mr. CAVENDISH BENTINCK offered us the very comfortable counsel that we should let things alone, and wait for something to turn up. One would have thought that now was the time when occasion offered. We have a fine design, and, what is almost rarer, we have competent men who sympathise sufficiently with that design to take it up *con amore*, and at some personal sacrifice (as Mr. ARCHERSON pointed out) devote themselves to the work. In these days, when architects are not painters, nor painters architects, it may be desirable to some extent to distribute the responsibility of the undertaking, and to associate with Sir FREDERICK LEIGHTON and Mr. POYNTER, if they are willing, Mr. HUGH STANNUS ; but whatever is done, and by whomsoever, the only conditions under which the decoration of the dome of St. Paul's, or any other great work in decoration, can by any possibility be a success is that we let the artists as much as possible alone, and do not hamper them over-much with instructions or restrictions.

#### NOTES ON EXHIBITIONS.

THE traditions of our water-colour school still linger within the galleries of the Royal Society of Water-colour Painters, and keep up its exhibitions as the most representative of excellence and variety. The sketch and study exhibition of this winter season, opened more than a week since, has the interest belonging to genuine examples of preparatory work. Mr. ALBERT GOODWIN's delicious little bits of Italian towns are sometimes hardly more than the daintiest indications of building and perspective view, hardened into outline out of a mist of graduated rose and ochre. Other pastoral English subjects are manifestly outdoor work. The manipulation of Mr. GOODWIN is peculiar. He seems to rub and soak his paper sometimes past belief, and yet the forms are always delicate in *finesse*, while he attains to a fruity bloominess of colour quite his own. Mr. BOYCE, often an absentee, sends some sketches done in past years in Scotland and England, quietly faithful, and luminous as possible, having an individual character in the selection of homely or unlikely subjects that, in the hands of an artist less intimate with nature's magic, would be prosaic. The uplands and pastoral scenery of England find good interpreters in Mr. THORNE WAITE, Mr. TOM LLOYD, and Mr. EYRE WALKER. *Summer Morning in Yorkshire*, by the last-named, is admirable for gradation of misty sunlight diffused over the greens of a wooded valley, broken into variety of tint by successive distance. Mr. DAVIDSON is strong in broad coast studies, especially in the skies. Some important painters do not show. ALFRED HUNT has nothing, nor A. FRIPP, nor Mr. TADEMA, nor Mr. HALE. Mr. FRANCIS POWELL sends only a small and clever study of autumn foliage—quite a novel line of subject from him. Mr. HENRY MOORE also exhibits landscape, a welcome variety in his programme of sea studies : *Farm at Walberswick* is crisp, luminous, and honest outdoor work.

At the official head of the figure-painters, President Sir JOHN GILBERT slashes away with his broad, wood-draughtsmanlike touch in a *melée* of horses and men beating *A Retreat* across a swollen ford, and in an attempt to make the subject of the *Prince and Princess of Wales Going to a Drawing Room* attractive by a blaze of scarlet-coated soldiery, and a play on red, black, and white. Mr. CARL HAAG fortunately has been in the mind to send two old studies of Eastern heads in his good first—or, perhaps, properly speaking—second manner. Mr. CHARLES GREGORY has been busy in Brittany with groups of *Blanchisseuses*, and women chaffering at fruit-stalls in picturesque nooks : clever, bright, well-drawn studies all, only wanting strangely in coherent composition or selection.

A more serious school finds exponent in Mr. POYNTER's chalk heads, and like studies by Mr. ALBERT MOORE ; and Mr. SHIELDS shows one of his full-length designs—an *Abel*—for the Te Deum window at Eaton Hall, a finely-conceived figure. The introduction of black-and-white work is a great gain to these winter exhibitions, as, on a lower level, is the use of toned mounts. Unluckily the white mounts have the overwhelming preponderance, and swamp in a dazzling margin, doubled by juxtaposition, many good drawings. It is disappointing to find no architectural or interior subjects by Mr. HODSON. The best things in this line are by Mr. HENRY WALLIS—a *Bishop's Tomb*, and *Doorway of Don Pedro's Palace, Toledo*, both impressive studies, splendid in colour and texture, though rather blurred in execution, and an unexpectedly satisfactory picture of the *Interior of St. Bartholomew the Great*, by Mr. ANDREWS, which is worth ever so much more artistically than that painter's Spanish galleons and British men-of-war.

The Fine Art Society is showing a roomful of water-colour drawings in Venice by M. ROUSSOFF, a Russian artist, who, it is said, evades the arbitrary veto against pursuit by a noble of a profession, under this pseudonym. This is not the first time that the dashing studies of this painter have been shown in the same place ; indeed, one or two drawings already exhibited swell the number of the present collection. M. ROUSSOFF is at home in modern Venice ; he loves its nooks and corners, its vivacious people, its charm of reflected lights and narrow perspectives in side canals, its peeling, plastered walls, opaline in play of colour, its remnants of rich sculpture in out-of-the-way places. With singular surety of hand, that needs hardly a pencil-line to guide it, he draws in with the brush what of all this and other subjects attract him, and plays with a brilliant palette that runs from delicate and pearly greys to a motley breaking out into crude irruption of metallic hues in a scheme else fully harmonious. Large and clean in his full wash of aquarelle, his method is wholly unlike the stippling and scrubbing by which much modern English work has attained peculiar effects. It is the kind of ready art that might degenerate into cheap show, but hitherto only progress and a consolidating style are apparent, so that one may hope much of M. ROUSSOFF. Skilful in the use of the figure, two of the most attractive pictures have place within the rich and carved *coro* of some Venetian church : a white-haired canon watching like *The Cat and the Mouse* a young chorister poring over a ponderous choir-book ; or the same old man leaning reposefully in his stall and listening to the hungry-looking *Novice* who reads aloud the office of the day. The clever modelling of the faces, the accurate expression of attitude, the whole narrative putting together of the subjects, are artist-like in high degree.

Whoever wants to see the finest study of childish beauty and expression Mr. MILLAIS has painted for a long while, should go to Mr. WHITE's gallery in King Street, and look at *The Little Waif*. Where the painter found such a model, he and heaven know best ; but exquisite she is, with the yearning eyes of mysterious experience, and the sweet grave mouth of exquisite innocence. The picture is to be published in photogravure by Messrs. DOWDESWELL, and is painted with heavy impasto, that looks, spite of masterly brushwork, rather unctuous and sloshy.

At the same room, which holds at present a good deal that is interesting, hangs on view Mr. ORCHARDSON's last and best picture. The subject is an eighteenth-century ball-room incident, where a young girl, fresh from the school-room, all shy grace and beauty, makes her *debut* in *Her First Dance*—a minuet—with a dashing young man of the town, both duly gazed at and gossiped over by groups of critical onlookers. The whole narrative tells like a chapter by JANE AUSTEN. As usual with this painter, the figures, on comparatively small scale, are placed upon a canvas with large unfurnished spaces ; but this time Mr. ORCHARDSON has been at pains to tone with utmost care for delicate gradation the expanse of pale panelled wall and waxed oak floor. Moreover his painting throughout is painting, and not etching with the brush ; the flesh is admirably modelled, the textures are deftly indicated. The scheme of composition is balanced with excessive care—a wrong line would have thrown it all awry ; but it is entirely out of Academic rule, and has that accidental look about its order which is supposed by fond æsthetes to date from Japan. This picture also is to be brought out in photogravure by Messrs. DOWDESWELL.

## THE ARCHITECTURAL ASSOCIATION.

THE fourth ordinary meeting of the Association was held on Friday evening, the 5th inst., Mr. Cole A. Adams, president, in the chair.

The following were elected members:—Messrs. W. F. Cave, A. J. Stock, W. Simion, L. Sargeant, E. E. Wilkins, A. W. Shortbridge, F. J. Stone, A. R. Jemmett, T. C. Agutter, H. A. Pertwee, R. A. Rix, B. Woolard, R. J. Haddon, E. H. Fry, H. Wilson, F. J. Curwen, E. T. Gosling, J. Mussellwhite, J. R. Lawes, J. Barratt, R. C. T. Gordon, G. M. Inkpen, R. H. Weymouth, W. H. Parry, W. Randolph, E. H. Parks, E. W. Monro, A. Baker, A. F. Usher, A. W. Osborn, F. S. W. Goldsmith, V. R. Page, P. C. Turner, W. H. Hargrave, A. H. Worsley, E. Wright, B. Nordan, H. A. Reeves, T. Davison, H. G. Lidstone, J. Greateorex, H. S. Donaldson, H. Freeman, T. Duncan, W. M. Duke, G. Wilson, A. W. Soames, W. A. Finch, E. H. W. Holt, F. Fogerty, W. O. M. Morice, S. B. Beale, E. Woodthorp, F. Tayler, E. Brown, W. B. Gwyther, J. H. Wilson, W. A. Rapley, J. Haigh, E. H. Payne, J. Hudson, H. Fearis, F. G. W. Buss, E. Barnsley, F. T. W. Miller, C. C. Winmill, G. C. Nichols, H. H. Gordon, D. D. Jones, M. L. Ashburner, Hewitt, and W. N. L. Tayler.

THE PRESIDENT stated that Mr. Brooks, architect, desired to become a member, and he was then elected by acclamation.

Dr. DRESSER, Ph.D., F.L.S., then gave a lecture, the subject being

### Some Features of Japanese Architecture and Ornament.

Dr. DRESSER said that during the last week he had received notice to leave home. During the interval he had visited eight or ten towns, and had just managed to get back home in time to see them that evening, but he had not been able to prepare any paper to read to them.

Japanese architecture, he said, was in part native and in part foreign. Japan was in some respects similar to Great Britain, and consisted of three parts, with this difference, that the northern part was an island detached. It was inhabited by a simple race of most primitive manners, whose dwellings were of a very rude character, and whose temples were scarcely of a more advanced nature. Here was a photograph of one of the Ainos temples. These temples consisted merely of the trunks of trees fixed in the ground in a more or less vertical manner, with horizontal members above, and covered with a rude thatch. The main feature of the building was the roof, which was intended as a shelter both from sun and storm, and was supported on uprights. The most architectural of the Japanese edifices consisted of certain uprights and tie-pieces, while the primitive habitations were similar to the Ainos temples. Japan derived much of its architecture from Asia. From an early period there was communication between Japan and the Corea, which for a time became tributary to Japan. In the third Christian era hawking was introduced into Japan as a sport, and in the crests of the nobles hawks' feathers were introduced to show their fondness for the sport. Some of the architecture was derived from India, brought thence by the Buddhist missionaries. He had seen a temple of purely Indian work at Ugi, an outlying district of Kioto, which the priest admitted had been built six centuries ago by the Buddhist missionaries. Confucianism was not in any sense a religion with the Japanese, but as the nobles had to study the works of Confucius, or the duty of man to man, great temples had been erected to Confucius in Yeddo, Tokio, &c. One great temple, built after the model of a Chinese temple, had been converted into a library. Here we had Chinese influence directly brought to bear on Japanese architecture.

Chinese architecture had two sources. All were familiar with the residences on water, or lake dwellings, probably erected for safety's sake. As far as he understood it, the Chinese had resided in boats on rivers from time immemorial. Not that they lived on the water because there was no room for them on land, for there were immense tracts of land available; but they lived on the water because their ancestors had done so, and no doubt at some time lived on it for safety. He had a photograph of a Chinese temple, from which it could be seen that the architecture was boat-like, and had been derived from boats. The other source of Chinese architecture was the tent. Buildings were formed with poles crossed near the top, and projecting above. There were also buildings with right-lined members, the origin of which was not so easy to define. The Japanese had never, as far as he knew, adopted the junk-like architecture, but in many instances they adopted the tent-like, as also the right-lined form. A photograph of one of the greatest shrines in Japan showed this tent-like character. There were many other proofs that the architecture was to a great extent derived from China. One peculiarity was that the columns, as in the case of the important shrine at Nikko, was entwined with a dragon ornament, and here he had a photograph of a Chinese temple with the dragon on the columns. The different forms of latticed window-work in Japan corresponded with that in China. Key-patterned balconies and pagodas similar to those in China were to be seen in Japan. A gate similar in character to that which allied Chinese to Indian work, but far more simple in style, occurred also in Japan. They might, then, take it for granted that much of the architecture was derived from the continent of Asia, and proceed

to other considerations, first of all observing that it was generally held by Europeans that the Japanese had invented nothing, but had improved on everything derived from foreign sources.

The oldest building in Japan was erected more than 1,800 years ago, and during the whole of those centuries the seven buildings of which the shrine consisted were razed to the ground every twenty years. But before one timber was removed, another exactly like it was made, and so the whole was reconstructed, the idea being thus to convey the impression of perpetual youth. In its central compartment was placed the sacred mirror, which the Japanese believed was sent down from heaven and given to their empress. So sacred was it esteemed to be, that not even the chief priest entered that building—the Mikado alone could enter. In this building we got the first specimen of Japanese architecture known to exist. Next came a triangular building formed of logs of wood, that for 1,200 years had contained the treasures of the Mikados. He had been permitted to examine almost everything in that strange building. The inventory of its contents made 1,200 years ago was said to correspond exactly with the things now in that marvellous chamber. Many of the objects certainly were from Central Asia. Religion, climate, and material had all influenced the architecture. The religion was Shintoo, a most primitive form of religion, of which the great symbol was the mirror. Every temple had its mirror, in imitation of the sacred mirror before spoken of. The idea was that everything a man did should be capable of being revealed to the world, just as his own image was revealed to him in a mirror. Shintoo comprised also the worship of the sun, fire, and of heroes. Demanding that everything a man did should be capable of being revealed, it enjoined the most perfect workmanship, and that nothing should be "scamped." All were familiar with the perfect finish of Japanese articles. The same careful work was found at the bottom of a box as at the top, inside as outside, &c. This principle was so perfectly impressed on them that no educated Japanese would be seen in company with a "scamper" of work; but the faithful, honest workman, the art workman especially, was the friend of princes.

Then, for another thing, the Mikado was the god incarnate of Shintoo. Just as in the temple, so in every house in the land, a little altar was found—a little altar or dais with a niche, and a vase containing an offering; a joss stick or flowers was placed there to the god of the altar, that was to say, the Mikado, for should the Mikado visit a house he would sit on the altar as the god of the land. The Japanese treated these niches with the greatest reverence, and constructed them with the utmost care. In the poorest of houses they were beautifully constructed of wood, and so smooth and so lovely that it was positively a delight to see them. It exercised a great influence on the taste of the people because it was a part of every house in the land. Everything about the Mikado, however, in his personal surroundings, was absolutely of the plainest character, and when he died, his tomb, his monument, was only a mound of earth.

Then there was the worship of the sun and of fire. He had a plan which he had bought on the spot itself, that showed two rocks standing out in the sea—the rising sun, and a little altar. At a particular time of the year, standing behind the altar, and looking in a particular direction, the sun was seen rising midway between the rocks. He had stood thus and seen it, and as he was never behindhand in his devotional practices in Japan, had purchased frogs and offered them to the rising sun; he must, however, confess to having afterwards, unseen by the priest, taken back and pocketed some of the frogs, as he wanted to keep them. Whenever there was a Shintoo feast braziers of fire were lighted all round the shrine, and the priests said their incantations to them. As to the worship of heroes, any man who had done something great for his country was deified after death, as, for instance, the man who had made the harbour.

For seven centuries, up to the year 1868, the Mikado had never been among his people. His was too sacred a person to be seen except by his courtiers. The person they saw first in Japan was not the Mikado at all, but the chief of the Shogun or nobles. This man's income was equivalent to three millions sterling of our money, and, taking into account the purchasing power of money in Japan, he was the richest potentate on earth. The head of the Shogun was a Buddhist, and while the Mikado was always shut up in his palace and informed that everything was going on well, the head of the Shogun, who went about the country, was always encouraging Buddhism. One of the most interesting results of Buddhism was that it induced a most perfect harmony between man and all created things. A child was never known to hurt an insect or an animal. Butterflies came at their call, and the birds played with them. The moat around Tokio Castle was densely covered with wild geese and ducks, and for 700 years not a hand had been raised against them.

As to climate, they had a wet season, when for six weeks there is an almost incessant downpour of rain. The southern portion of Japan was tropical, the middle semi-tropical, while the most intense cold—so cold as to be almost unbearable to Europeans—prevailed in winter in the north, and even in central Japan. Fire was not used as a heating power. The climate, therefore, demanded that you should have a roof over your head. Japan

was a land of earthquakes, and that had been one of the greatest difficulties the Japanese architects had to overcome—to devise their structures so that they should not be overthrown by them. He had been, he believed, the first to enunciate how the Japanese pagoda was built. They must not credit him with finding it out, for he did not. His interpreter had shown it to him. In Tokio was a temple dedicated to agriculture. In a visit to it, when he gained the top he said to this person, "Your architectural construction is wrong—your timbers are far too heavy, and you have a huge pole coming up the middle here. If you use those great corner timbers, you do not want this middle one." "You don't understand," was the reply. This central rod was not continuous, but it hung in the building like the clapper in a bell. At the bottom of the building by lying down it could be seen that it was pendent. During an earthquake the pole swung, and thus always kept the centre of gravity within the base, so that no pagoda had been known to go over. Every Japanese house was loose from the ground; it was not fixed. The houses consisted of a certain number of uprights, horizontal pieces, roof and floor. If an earthquake occurred, the house which rested on stones would rock about, and then settle down again. The Japanese built only their castles of stone. The walls were built of enormous stones, the batters all leaning inwards. As the buildings were of wood, they must be protected from rain. The lower part of every column was encased in bronze, so that the water could not get in, and the same with the ties and other members of the structure. There must be a roof. Walls, palings, and even clothes-props had roofing to protect them from the weather. He regretted to say that some Englishmen had been trying to persuade the Japanese to erect buildings of brick. If they allowed themselves to be persuaded, the first earthquake would bring them down, and the Japanese would be sorry that they had adopted our notions. Etiquette entered into architectural matters. If a plan was wanted, the public master of etiquette must furnish it. Numerous restrictions, which he must pass over, were imposed, the number of doors would be limited, and so forth. The roofs were of many kinds, and included those of simple character, with gable and thatch, and others with a series of gables and a series of roofs, in some cases thatched, in others covered with tiles. Balance was more easily preserved in earthquakes by having top weight, and so tiles were preferred, though where the tiles would get shaken off and do damage, they substituted thatch. A most exquisite thatch was obtained by using little plates of the inner bark of a coniferous tree. Photographs showed all these details, and displayed the internal construction of the roofs, and the external aspect, and also some curious curved roofs. The roofs were supported by a system of bracketing; the roof was brought out gradually on brackets. In some cases the brackets were most appropriate, in other instances they carried the system to such a degree of complication that it was almost impossible to understand it at all. Ceilings were generally coffered, and were often of great beauty. Ceilings of temples were coffered, occasionally richly decorated with flat ornament, occasionally with carved work. Columns were generally circular. There were also octagonal columns and fluted columns. They were sometimes enriched with a spray of blackthorn twisted round, or with a dragon, and in many cases were covered with fine diaper work.

The construction of walls was next described by the lecturer, who then went on to call attention to the most important Buddhist shrine in Japan, a map of which he had bought on the spot at Nikko. The shrine was approached through an avenue of coniferous trees forty miles long, the last ten miles of which was formed by a double row of trees on each side, some 150 feet high, the enormous branches of which interlocked and formed a solid living arch. For a thousand years no woman entered it, and he believed he was the fifth European to visit it. In it were eight thousand lanterns, and he found the priest engaged in thawing the oil in a cauldron to feed certain of them that had to be lighted. For a Japanese map it was almost a true map. It showed the long, straight road leading to the shrine as turning round and coming back; but the fact was there was not enough space left on the paper to carry it straight on. The shrine itself on the map was tolerably accurate. At the end of the road a gate, of singular character, called a "torii," was entered, and a pagoda passed on the left. Before, however, getting to the pagoda there is a curious column, very small, but the whole of the Buddhist Scriptures are contained on it. Passing the pagoda, a courtyard was entered, with a curious triangular building of logs. Then there was a water-tank, generally a very beautiful and wonderful structure. It consisted in this case of monolithic granite columns, which slightly sloped inward, their upper portions encased in gilt bronze. The water-tank itself was a great granite vessel, so exactly level that after the water entered at the bottom and filled the tank it flowed over the entire edge. Every one had to wash themselves, and also to wash their mouth out, before entering the temple. In this courtyard there was also a stable, in which a sacred horse was kept; the stable and fittings made of plain pine wood, exquisitely worked. A perfect gem of art was seen in some most exquisitely-carved panels. Next, passing along under another of the curious torii (and this gateway had a curious lotus-leaf base), a series of steps were reached that led to another court, in which were several

beautiful buildings, and, among other things, two strange objects—a huge Gothic lantern, and the other a Renaissance candelabrum. presents probably from the Dutch, who paid a yearly tribute. One of the buildings in the court was a belfry. Passing into the inner court the sanctuary itself was reached, the finest specimen probably of Buddhist work in the world. The marvellous execution of the carving and the diaper-work were worthy of attention.

Time, the lecturer said, would not allow him to speak of many points he had intended. He had been going to speak about ornament as springing from the architecture, but there was little to be said about it. The Japanese had a distinct conventional ornament besides that which consisted in the representation of natural things, and he might have shown how some was derived from the worship of fire. He had had some drawings made by one of the best Japanese artists of flat surface decoration, and, among other details he pointed out here a column, there a tie-piece, brackets, the horizontal members, and called attention to the fact that the diaper-work fitted exactly on the beams, while in the architecture he had not found any example of the odd cutting off so characteristic of their decorative work. In connection with the temples, the lecturer spoke of certain columns with a representation of water on them. He had a word to say about that. When his work on Japan appeared some years ago, a writer, reviewing the work, asked what ornament could be more absurd as applied to architecture, and said that the author himself appeared to have had some difficulty in swallowing the water. Then, in another article, speaking of the design of certain columns of the Natural History Museum at South Kensington, ornamented with representations of water, fishes, &c., the writer remarked that the effect of such treatment was very refined, and gave an interest, &c., &c. The lecturer said he had also intended to say a word about the beautiful poetry of Japan. There was a poetry about almost all they did or said that separated Japanese art from our own. Scarcely a thing or a building but reminded the Japanese of something loved or dear to him. Nothing was done by them but with a care that manifested the utmost interest of the workman, and he would that he could show them how all these details appealed to a people who loved nature, and who felt that they were cared for by nature.

The PRESIDENT in thanking the lecturer for his address, referred to Viollet-le-Duc's remarks on the pyramidal form of construction in regard of its suitability for preserving the centre of gravity on occasion of earthquakes. He noted the fellowship that existed between Greek and Japanese art, inasmuch as the same loving care and precision of hand was apparent in each, and that great charm and beauty of their art, that they approached nature so closely, and yet so perfectly preserved conventionalism.

Mr. STATHAM proposed a vote of thanks to Dr. Dresser. He spoke of the remarkable way in which the Japanese made use of everything that was close to hand, turning it to artistic purpose, and putting on everything a finish which was an example of thoroughness seldom to be found in the present day. As was apparent from the lecture, a great deal of the ornament was perfectly irrelevant in particular cases. They put on an object all the ornament they could, and its beauty enchanted the beholder, but it did not bear that relation to its position, space, &c., which ornament properly applied should do. This showed an illogical mind, and in this the Japanese differed from the Greek because he had not the logicalness of the Greek. As to the water decoration, fishes, &c., at the Natural History Museum, Mr. Statham thought that ornament was not out of place. It was symbolical, for it was applied to the columns in the Fish Museum. A column was essentially meant to support weight. The Greeks gave nerve and sinew to their columns by fluting, &c. The Japanese put the water ornament on his column, and amused himself in that way.

Mr. J. O. SMITH said the columns at South Kensington with the fish ornament were to be found in the mineral gallery, the bird gallery, the mammalia gallery, and nearly every gallery except the fish gallery.

Mr. BLAGROVE suggested that a symbolical meaning might be attached to the representation of water in the Japanese work, which would render it appropriate.

Mr. STANNUS said that considering the idea of safety being connected with columns, as in the case of lake dwellings, the imaginative and poetic temperament of the people might have allowed them to represent water from a poetic idea on the columns to which they were so much indebted. Mr. Statham's view of their want of logic he should prefer to call a want of reticence, and to say that the Japanese artist never knew when to hold his hand, whereas the Greeks practised temperance, a virtue that tempered all others and taught the Greek where enrichment, as well as roughness or rudeness, should stop. In conclusion, he seconded the vote of thanks.

Mr. H. D. APPLETON, hon. secretary, regretted that they could not see all the specimens that Dr. Dresser had offered them that night to illustrate his lecture. As it was, however, the photographs, &c., exhibited could hardly be done justice to for want of room to place them, and had Dr. Dresser's other treasures been brought no one would have been able to get into the room.

Mr. BURROWS asked if there were any stone quarrying in Japan.

Mr. PITE cordially supported the vote.

Mr. W. H. ATKIN BERRY, hon. secretary, said the map of the shrine explained to them by Dr. Dresser, reminded him of Mark Twain's map of Paris. He asked if they made plans for the erection of their buildings, and if so, if they prepared them in the same light and easy way.

The PRESIDENT, in putting the vote, which was carried by acclamation, said that Mr. T. W. Cutler had been prevented from attending by illness, and that he hoped that gentleman would soon be restored to health.

Dr. DRESSER said he had meant to point out Mr. Statham's error about the columns at South Kensington, but this had already been done, but he might add that the reviewer of his book had not said one word about the Japanese water ornament being objectionable because inappropriate; nor had it been said that Mr. Waterhouse's ornament was beautiful because it was appropriate. Certainly when the columns were designed it was not quite settled as to what rooms would be devoted to the different classes of creatures. It might have been his fault that he had led readers of his book to suppose that representation of water was a common decoration for columns, but it was not common. In the case of the temple, the columns of which they were speaking of, it was dedicated to the fish god. He had no knowledge that quarrying ever took place in Japan. It was said of Osaka Castle, and he had heard the same of the castle at Tokio, that the stones had been brought 200 miles, and the curious thing was, how did they managed to bring them when there were no roads, but only narrow little raised banks between the rice-fields. Carefully drawn plans were prepared by the Japanese for their buildings. They drew elevations, but put in little bits of perspective to help out the elevation. They were not very unlike the usual architectural elevation. He had seen the plans for the rebuilding of the Temple of Shiba, which had been burnt down, to his regret, for he should have wished to have seen it. He gave a donation towards the rebuilding, and a few days after, in passing, he saw a large frame containing the names of people who gave subscriptions on little wooden labels, and he found his own name, in English:—"The Great Professor Dresser, of London." The priest promised always to pray for his soul, and for his country's soul.

An immense number of photographs illustrated the lecture, and were pointed out in explanation of points of construction and ornamentation which Dr. Dresser wished to call attention to. In every case Dr. Dresser had seen the object photographed. On conclusion of Dr. Dresser's reply, these were examined with much interest.

## MR. RUSKIN ON LANDSCAPE.

MR. RUSKIN'S final lecture to his pupils for this term, given at Oxford last week, began, says the *Pall Mall Gazette*, with an expression of the "disappointment and surprise which, on reviewing the results of my lecturing and working here for upwards of twelve years, I feel in being forced to the sorrowful confession that not a single pupil has learned the things I primarily endeavoured to teach, nor used of his own accord, so far as I know, in a single instance the examples which I put before him as most admirable in my especial department of art, landscape."

### *Examples of Landscape Drawing at Oxford.*

How complete and numerous these examples are every one knows who has visited the Taylorian picture gallery or seen in the "Ruskin drawing-school" the insides of the cabinets filled with Mr. Ruskin's own drawings. "You may wonder," continued Mr. Ruskin, "why the examples I have given you of landscape in the school are my drawings and not Turner's. But Turner's are of a finesse beyond what has ever else been attained, and for that reason not useful as working examples. But I am proud to think that these drawings of mine (several of which were exhibited at the lecture), done thirty years ago at the foot of the Matterhorn, are entirely right as examples of mountain drawing, with absolutely correct outline of all that is useful for geological science or landscape art. And I am proud to think, too, that though at the time I did them I had never seen Turner's drawings, mine are on exactly the same plan as his—that is to say, I always drew an absolutely right pencil outline before putting in any colour whatever. But though I have been preaching, crying, shrieking to you that this is the method of all true landscape painting, there is not one of you who sharpens his pencil-point instead of seizing his biggest brush and going dab at the mountains with splotches of colour. And then in the gallery upstairs there is the unequalled collection of Turner drawings, which with some self-denial I gave you twenty years ago, and which has lately been completed by the kindness of the trustees of the National Gallery at the intercession of Prince Leopold."

### *Neglect of Them by his Pupils.*

Why was it, then, Mr. Ruskin returned to ask, that none of his examples in landscape had been used, none of his principles adopted? "I perhaps trusted too much to what I had before written on the subject of landscape; and in the first years of my

professorship drew the attention of my pupils only to the higher conditions of pictorial imagination, which had been occupied in religion and ethics. As it has turned out, the religion of England being in its practical power extinct before her science, and the ethics of England extinct before her avarice, everything that I have written of the religious paintings of Italy has been useless, until lately in the form of guide-books; while the value of the few words I spoke on landscape was still more hopelessly effaced by the vast irruption of sensual figure study, patronised by the now all-powerful Republican *demi-monde* of the French capital. Respecting the general relations and dignities of landscape and figure painting, I propose very earnestly and carefully to address you in a spring lecture. But with respect to the especial danger and corruption of existing schools of the figure, I must point out one or two chief facts for your immediate consideration."

### *Landscape Superior to Figure Painting.*

"First, landscape, however feeble or fantastic, cannot be definitely immoral. It neither mocks what is venerable, nor recommends what is lascivious. But the sale of figure sketches or paintings by persons of inferior talent depends almost exclusively on its being addressed to the vanity, the lust, or the idle malice of the classes of society developed by the corruption of large towns. Secondly, the idea of greater dignity, naturally attached to figure painting of higher pretension because it implies a strict course of previous academical study, entirely ignores the primary law of human education, that the more you teach a fool, the more manifold a fool you make him. Nothing is so melancholy, nothing so mischievous, as the academical imitations of the great men by the little ones, and the pompous display of laboriously artificial attainments by men of faculties inherently and natively contemptible. During the first half of this century the artists of England were divisible almost without exception into two classes: men of modesty, sense, and industry who were forming a pure school of pathetic and meditative landscape, rising with the quiet flow of a mountain well out of the formality of the older 'views' of this and that; and men, on the other hand, of mean ambition, foolish sentiment, and vulgar breeding, who reduced the figure-painting of the Academy to the inanity from which it was only rescued by the splendid indignation of Rossetti, Millais, and Holman Hunt—all of them, observe, introducing, if not as the basis, at least as an essential and integral part of their conception, a landscape elaborated to the last grass blade and flower petal."

### *Greater Difficulty of Landscape.*

"Thirdly, I will not in this brief notice touch on the actual difficulties of landscape, as compared with figure painting; but I beg you to observe the requirement for it of far greater industry. With an hour's work a good figure painter can produce a satisfactorily realistic image of the fairest human creature; set him to paint a heathy crag or a laurel coppice, and see what he will make of it, giving him an hour for every former minute, or sixty hours instead of one. Why then paint it with so much care, do you say, when the painting of the pretty lady is so much nicer? Well, my own answer to that would be, because the pretty lady herself is so much nicer than the painting, and will always be there if you ask her, but the laurel coppice or the heather crag won't come for the asking: you must paint them or forget them. That in parenthesis. Returning to my main point, note that the painting of landscape requires not only more industry, but far greater delicacy of bodily sense and faculty than average figure painting. Any common sign-painter can paint the landlord's likeness, and with a year or two's scraping of chalk at Kensington any cockney student can be got to draw, effectively enough for public taste, a straddling gladiator or a curly-pated Adonis. But to give the slightest resemblance to, or notion of, such a piece of mountain, wildwood or falling stream as these in this little leap of the Tees in Turner's drawing, needs an eagle's keenness of eye, fineness of finger like a trained violinist's, and patience and love like Griselda's or Lady Jane Grey's."

### *Delight in Landscape dependent on Human Sympathy.*

"Without, however, further reasoning just now why or with what feelings we should try to paint landscape, I return to my immediate business, to ask you why, in no single instance, any of you have painted a bit in my way. For one of you that used to go to Scotland or Switzerland, a thousand go now; for one descriptive passage in poetry or novel that used to be given before Scott and Byron told you that nature was beautiful, a thousand romancers and troubadours paint now their landscape backgrounds for personages whom they couldn't make else of any account; and yet here are twelve years I've been your drawing master, and not one of you has brought me a bit of Alpine snow, of Greek sea, or of English greenwood drawn with as much pains or heart as dear old William Hunt has put into a horn tankard. I do not know what your answer would or will be. But my own explanation of this scorn of landscape will certainly surprise you. I attribute it, and I attribute it with a very strong conviction, to your having no sympathy with the people who inhabit the countries you visit. No passage of my old books is more often quoted than that in the 'Seven Lamps' as to the entire interest of landscape depending on our sympathy with

its history and inhabitants." The passage in question is that in which Mr. Ruskin describes "the broken masses of pine forest which skirt the course of the Ain above the village of Champagnole, in the Jura," and which he read in one of his former Oxford lectures, telling how much trouble he had taken to find the alliterations:—

It would be difficult (Mr. Ruskin says of this scene in the Jura) to conceive one less dependent upon any other interest than that of its own secluded and serious beauty; but the writer well remembers the sudden blankness and chill which were cast upon it when he endeavoured, in order more strictly to arrive at the sources of its impressiveness, to imagine it, for a moment, a scene in some aboriginal forest of the New Continent. The flowers ("in clusters crowded, for very love") in an instant lost their light, the river its music; the hills became oppressively desolate; a heaviness in the boughs of the darkened forest showed how much of their former power had been dependent upon a life which was not theirs, how much of the glory of the imperishable, or continually renewed, creation is reflected from things more precious in their memories than it, in its renewing. Those ever-springing flowers and ever-flowing streams had been dyed by the deep colours of human endurance, valour, and virtue; and the crests of the sable hills that rose against the evening sky received a deeper worship, because their far shadows fell eastward over the iron wall of Joux and the four-square kesp of Granson.

"But this point," Mr. Ruskin said, "I have never enough reinforced. The lecture in which I partly did so was never published; and you all go rushing about the world in search of Cotopaxis and Niagaras, when all the rocks of the Andes and all the river drainages of the two Americas are not worth to you, for real landscape, pathos, and power, this wayward tricklet of a Scottish burn over its sheets of low-levelled sandstone." Mr. Ruskin here showed the early Turner which he has lately acquired, and to which he referred, it will be remembered, in a former lecture. "Its whole force," he said, "consists in a dreamy and meditative sense that men were once living there, and spirits still moving there—that it was full of traces of the valour of our ancestors, just as it may still be full, if you will, of the traces of your love."

#### *The Contrary Case, Illustrated from Evelyn's Diary.*

To illustrate the contrary case—the absence of delight in landscape accompanied and conditioned by a want of sympathy for the people—Mr. Ruskin read a series of extracts from Evelyn's Diary, written for him by his god-daughter with a type-writer—"the only kind of machine of which I do approve." First there was English enjoyment of English landscape, telling of a piece of white marble "stained with a lively red, very deepe, as beautiful as if it had been natural;" and of Spie Park, where the house had "not a window on the prospect side." That is the rough type; for the gentle type Mr. Ruskin referred to Evelyn's building a study, a fishpond, an island, and some other "solitudes and retirements" at Wotton, which "gave the first occasion of improving them to waterworks and gardens." As for English travellers' enjoyment of French landscape, "we passed through a forest (of Fontainebleau), so prodigiously encompass'd with hideous rocks of white hard stone, heaped one on another in mountainous height, that I think the like is nowhere to be found more horrid and solitary." For an example of "French and characteristically European manufactured landscape," Mr. Ruskin referred to Evelyn's description of Richelieu's villa, with its "walks of vast lengthes, so accurately kept and cultivated, that nothing can be more agreeable," and its "large and very rare grotto of shell-worke, in the shape of satyrs and other wild fancys." The human sympathy involved in manufactured landscape is to be seen in its cost—"he has pulled downe a whole village to make roome for his pleasure about it"—making a solitude and calling it delight. And then, lastly, Mr. Ruskin read an account of how Evelyn took his pleasure in the Alps, passing through "strange horrid and fearful craggs," and treating the natives—as only the British tourist knows how. The pious Evelyn, or one of his party, had a water spaniel—"a huge, filthy cur" that killed a goat, "whereupon we set spurs and endeavoured to ride away;" but inasmuch as "amongst these rude people a very small misdeemeanour is made much of, we lay'd down the money, though the proceedings seemed highly unjust." These proceedings occurred on the Simplon Pass; and Mr. Ruskin showed in contrast to them a drawing of the St. Gothard by Turner, in which, as in other scenes, it is a human interest that gives the grandeur. The reader will remember in this connection Mr. Ruskin's description of the Pass of Faudo in "Modern Painters," where in "Turnerian topography" the "full essence and soul of the scene and consummation of all the wonderfulness of the torrents and Alps lay in a postchaise with small ponies and postboy."

#### *From the Alpine Club—Modern Manners.*

"Now, I dare say," said Mr. Ruskin, resuming, "you all think you have improved greatly in sense and good nature and love of scenery since Evelyn's time. I admit there are a certain number of you very different creatures indeed. But there is nothing to me so amusing in Evelyn's injustice to the poor peasants and terrified hatred of their Alps as there is in the total absence from the papers of the Alpine Club of the smallest expression of any

human interest in anything they see in Switzerland except the soaped poles they want to get to the top of, and their continual exultation over their cheese and beer, in their guides' legs and their own, without ever appearing conscious for an instant that every valley of which the blue breaks through the cloud at their feet is full of the most beautiful human piety and courage, being gradually corrupted and effaced by European vice, after contending for long ages with conditions of hardship and disease prolonged by European neglect, folly, and cruelty. And of the less adventurous Englishman content with flatter mountain tops here without question is the central type for this hour." Mr. Ruskin here showed *Punch's* cartoon of *The Old Lion Aroused*, to which he had referred in a former lecture, and in doing so he apologised for any pain that had been caused by his thus accidentally ridiculing Mr. Bright—for whose character he had in most things a great respect, although it was an "awful sign of the times" that so honourable and excellent a man should have stood up on a memorable occasion in the House of Commons to defend the adulteration of food as a legitimate form of competition. "You are all of you," Mr. Ruskin resumed with reference to this cartoon, "resolving yourselves, and that with rapidity, into this kind of British person, and this kind of British standard-bearer—consumer of all things consumable—producer of nothing but darkness and abomination—with his foot on all that he once revered, his hope lost in all that he once worshipped—a god to himself, and to all the world an incarnate calamity."

#### *The Return to Nature.*

"Your way out of all this I told you full fourteen years ago in my inaugural lectures, to not one word of which any of you have practically attended. I have indeed one pupil-friend, an accomplished and amiable artist, another a conscientious and prosperous lawyer—of formal school or consistent disciples, no vestige whatever. The time may yet come; anyhow next year I have again, with the ever-ready help of Mr. Macdonald, to begin at the beginning, and meanwhile I will close my discourses to you for this year by re-reading the conditions of prosperous art work which I laid before you in 1870." The passage which Mr. Ruskin read is in the fourth of his inaugural "Lectures on Art," on "the relation of art to use," in which it was laid down that, after recovering for the poor wholesomeness of food, the next steps towards founding schools of art in England must be in recovering for them decency and wholesomeness of dress and of lodging, and then after this that "nothing be ever made of iron than can be as effectually made of wood or stone, and nothing moved by steam that can be as effectually moved by natural forces. . . . And until you do this, be it soon or late, things will continue in that triumphant state to which, for want of finer art, your mechanism has brought them; that, though England is deafened with spinning-wheels, her people have not clothes; though she is black with digging of fuel, they die of cold; and though she has sold her soul for gain, they die of hunger. Stay in that triumph, if you choose; but be assured of this, it is not one which the fine arts will ever share with you."

"All this," said Mr. Ruskin in conclusion, "is called impossible. It may be so. I have nothing to do with its possibility, but only with its indispensability. And at any rate this much is possible to you—to prefer life in the country though it be dull to life in London, though it is merry; to look at one thing in the day instead of twenty; and to think of that one in such way as will give you some love for man and some belief in God."

#### GLASGOW ARCHITECTURAL ASSOCIATION.

AT the last monthly meeting of the Glasgow Association a paper on the "Nature and Harmony of Colour" was read by the vice-president, Mr. Henry Baldie. Of the two theories held by Newton and Brewster regarding the number of hues of those colours called primary, that of the latter was preferred as most practical when dealing with pigments rather than rays of light. The nature of harmony when derived from the complimentary colours was then considered, and illustrated by numerous coloured drawings and diagrams, with applications of the principles advanced in both pictorial and decorative arrangements. Mr. James Smith opened the discussion which ensued. A vote of thanks to the essayist followed. The last visit of the season included a large warehouse now erecting for Messrs. Wyllie & Lochhead, in Buchanan Street, of which Messrs. Campbell Douglas & Sellars are the architects; and new chambers for the Clyde Navigation Board, also in process of erection, Messrs. John Burnet & Son, architects. The former building has a terra-cotta frontage, which, owing to the novelty of the material in Glasgow, attracted much attention. The other is noticeable from the spacious proportions of the apartments, and the elaborate elevation. A lofty fire-brick extraction-shaft is also a noteworthy feature. Mr. Shand and Mr. Douglas are the respective clerks of works.

A Conservative Club is to be erected at Streatham, at a cost of 2,500*l.*, according to designs by Messrs. Wheeler & Holland, F.R.I.B.A.

## NOTES AND COMMENTS.

THE large number of unemployed workmen in Paris is exciting apprehensions in the minds of the shopkeepers. What is to be done with hordes of vigorous men, who have no means of support except alms, and who are surrounded by riches on which they feel they have a claim? Under the Empire it was possible to meet similar emergencies by costly works, which were carried out without much thought of political economy. Nowadays it is supposed that public and private works should be determined by the chance of profit. The Paris contractors are unable to suggest any kind of public works which will repay the outlay. The Government can do nothing, and as the taxation of Paris is already too oppressive, the Municipal Council dare not undertake the formation of new streets. Many of the large buildings which have been constructed by public companies are remaining unoccupied, and are a warning to speculators. The masons, carpenters, house-painters, plumbers, are all complaining. The trade societies report that there are at least 10,000 painters and 10,000 carpenters out of work. If the building trades were flourishing in the provinces, there might be a temporary removal of workmen from Paris, but the same complaint of enforced idleness is heard in many parts of France. It is even feared that if the works for the exhibition of 1889 could be started, so many provincial workmen would be attracted to the Champ de Mars that the condition of Paris must be worse than it is at present. While trade is at a standstill it is admitted that there is an abundance of capital awaiting investment.

THE Walker Art Gallery in Liverpool contains a valuable collection of pictures. It is now felt that something more is needed if the gallery is to exercise an influence on local art. A speaker at a late meeting of the Scottish Academy pointed out that Liverpool is without a resident sculptor. Students of architecture are also handicapped. It is proposed to use the lower rooms of the gallery for a museum of casts from the best works in sculpture and architecture, arranging them in such a way as to indicate the history of art. The collection is to comprise at least one or two specimens of Assyrian sculpture, a small selection of Greek, Græco-Roman and Early Florentine sculpture, with casts of English, French, and German Gothic sculpture and wood carving. The examples in the British Museum, South Kensington Museum, and Architectural Museum would be utilised, and it is supposed that there would be no difficulty in obtaining copies from Paris, Florence, Rome, and Naples. Through the generosity of Sir A. B. WALKER sufficient funds are available for expenses. The project is deserving of general support. But if it is to be successful, the selection and arrangement must be left to artists. In Liverpool the amateurs are allowed to have more than their just share of influence, and it cannot be said that the result is entirely satisfactory. There is much hospitality by the members of the Arts Club and other societies; but dining and making speeches are not the best way to found a school. The Liverpool amateurs are eager in lionising if the lions come from a distance. Local art does not, however, count for much among dilettanti orators.

THE Old Water-Colour Gallery in Pall Mall contains an interesting collection of landscapes in oils and water-colours by Mr. CALVERT. The artist has studied in France, and the influence of MILLET is to be seen in his works. What is shown is out-of-doors work, and transient effects of light are well rendered. In some there is a solemnity which is more characteristic of the landscapes than of the figure pieces of the modern French school. The paintings represent a variety of scenes, from orchards to bleak shores, and in all there is work that is conscientious and able.

TRAMWAYS are now so general in this country that the question of working by steam has a general interest. From a paper which was read by the Hon. Mr. PARSONS at the Institution of Civil Engineers last week it appears that, where a frequent service is maintained, the cost of working the engines, including wages, fuel, oil, and repairs, is 2.28*d.* per mile run. For the engines and the cars, an annual allowance for depreciation at the rate of 10 per cent. is sufficient, provided the

ordinary repairs are paid for out of revenue. The depreciation on the line may be taken at the rate of 3 per cent. per annum, which is laid aside to form a sinking fund, interest upon which is allowed to accumulate at the rate of 5 per cent., and in this way the cost of the line may be paid off in about twenty years. As the result of these computations, the total working expenses of a line, including all items of expenditure, amount to 9.33*d.* per mile run. As a practical rule, every surplus penny per mile run above the working expenses gives 2.2 per cent. dividend to the shareholders. It is possible to obtain tramway engines which are quick and powerful in action, but hitherto engineers have been indifferent to the form of the engines.

THE election of the committee of the Society of French Artists is over. M. BAILLY is president for the year, and MM. GUILLAUME and BOUGUEREAU are vice-presidents. The following are the secretaries for the sections:—*Painting*, MM. VUILLEFROY and TONY ROBERT FLEURY; *Sculpture*, M. THOMAS; *Architecture*, M. CHARLES GARNIER; *Engraving*, M. JULES JACQUET. M. BOUGUEREAU is president for the section of painting, M. CAVELIER for sculpture, M. QUESTEL for architecture, and M. GAILLARD for engraving. M. TONY ROBERT FLEURY has for several years devoted a great part of his life to the administrative duties of the Society, and the artists have recognised his zeal by placing him at the head of the poll with 658 votes. Next in order are MM. BOUGUEREAU, J. LEFEBVRE, BONNAT, HUMBERT, DETAILLE, BOULANGER, CABANEL, and J. P. LAURENS. The last names on the list are MM. CAZIN and GEROME. M. MEISSONIER obtained only 327 votes.

ACCORDING to Mr. GARDNER, the English consul, a great trade could be done in timber in China were it not for the obstacles placed in the way by the native authorities. The reason alleged for discouraging the trade is, that the inhabitants of the forests are wild and lawless, and trade might lead to riots; perhaps the real reason is that they fear the country would be deforested. The taxes and cost of carriage for bringing down timber from places under forty miles' distance adds several hundred per cent. to the prime cost. In some parts of the country large oak trees can be bought for a few shillings. Labour is cheap, men can be got at 3*d.* a day; at Ichang 8*d.* or 9*d.* has to be paid. The Chinese do not value the oak. It is only used for burning into charcoal and for making the bottoms of canoes. With the native primitive tools the oak can only be sawn and shaped with great labour, and in the south it is useless for building, as the white ant especially affects it.

CONNOISSEURSHIP has received a blow through the discovery that a frame for a mirror by a worker in metal, who is now living in Paris, was purchased as a veritable antique by one of the ROTHSCHILD family. It was exhibited as Renaissance work. M. LEGROS, the artist, sold his work some years ago for a trifle. Afterwards he left France, and was employed for a time in Birmingham. On his return to Paris he found that his style of work was not appreciated. It is possible that, since his mirror frame has been taken for the work of a man who lived a couple of hundred years ago, there may be a demand for M. LEGROS' productions. But the discovery suggests the injustice of the modern system of art patronage. In this case we find a clever artist neglected, while vast sums are every year expended on works because they are old. If M. LEGROS would lend himself to the deception of allowing his works to be identified as those of BENVENUTO CELLINI, in a few years he might be one of the richest artists in Paris.

THE authorities of the Science and Art Department have called the attention of the Glasgow Corporation to the fires which have occurred in the Art Galleries in Sauchiehall Street during the past four years. It is considered most desirable that the galleries should be isolated, and not liable to the constant risk of destruction in the event of a fire taking place in any other portion of the building. From time to time there are loan exhibitions, and at present a collection of electrotype reproductions, on which the Department has a lien to the extent of 250*l.*, is placed in a gallery over a baker's shop. The subject was to be brought before the Corporation at a special meeting on Wednesday.

## ILLUSTRATIONS.

## DESIGN FOR A HALL AND STAIRCASE.

THE accompanying illustration is from a water-colour drawing of the hall and staircase of a proposed new house near Leatherhead, designed by Mr. LEWIS P. CRACE, architect, of 71 George Street, Portman Square, W.

## FARMHOUSE, NEAR DAVENTRY.

WE give as one of our illustrations a farmhouse erected at Drayton, near Daventry, for Mr. WILLIAM ROSE HOLDEN. On the same farm have also been erected buildings suitable in every particular for a first-class stock and dairy farm. The architects are Messrs. A. B. PHIPSON & SON, of Colmore Row, Birmingham, and the builders, Messrs. ROBERTS & SON, of Weedon.

## COTTAGES AT ARDELEY.

THIS pair of cottages has been built on the estate of Mr. J. J. SCOTT, of Ardeley Bury, Herts, in a pretty situation just opposite the old village church. Local materials are chiefly used—red bricks for the ground storey walls and brown tiles for the roofs; whilst the upper storey, constructed of timber framing, is finished externally in the fashion commonly met with in the district, having the entire surface plastered over and divided up by shallow mouldings into flush panels filled with various patterns scratched on the wet plaster.

The accommodation provided in each house consists of an entrance passage and staircase, living-room, kitchen, scullery, &c., with three bedrooms. The total cost was 500*l.*, which works out at about 4½*d.* per foot cube.

Messrs. J. & G. M. BATES, of Stevenage, were the builders, and Mr. WALTER MILLARD, of 19 Great George Street, Westminster, the architect, from whose drawing our illustration is taken.

## HUMPHREYS HALL AND ALBERT GATE MANSIONS.

THE block of buildings shown in the illustration is situated at Knightsbridge. The ground-storey has been laid out for shops, the first, second, and third storeys will be let for residential flats, and the fourth for studios, &c. At the rear is Humphreys Hall, which will be used as heretofore for exhibitions. The ground-storey is constructed of Portland stone, and the upper portion of brick. The works are being carried out under the superintendence of the owner, Mr. J. C. HUMPHREYS. Messrs. ROMAINE-WALKER & TANNER, 19 Buckingham Street, Strand, are the architects.

## DESIGN FOR FREE LIBRARY, BELFAST.

WE illustrate this week the principal elevation, fronting Royal Avenue, of the Belfast Free Public Library, as designed by Mr. THOS. R. RICHARDS, architect, of 17 King Street, Cheapside, E.C., being one of the drawings submitted by him in the recent competition for the building. The original was hung in this year's Royal Academy Exhibition.

The whole of the ground-floor is devoted to the libraries and reading-rooms, with the necessary offices, no space being wasted in useless passages and corridors. The reading-room measures 52 feet by 36 feet: on the right a large hall and staircase leading to extensive picture galleries—a feature in addition to the libraries to be provided, and it is located and kept distinct on first floor. On the right of reading-room is the lending library, 37 feet 3 inches by 29 feet 6 inches; ladies' reading-room, 28 feet by 25 feet; and committee-room, the latter looking out on front. On the left is the general library, 50 feet by 34 feet 3 inches; and adjoining, looking out on front, the select library and librarian's room.

The centre room is open to the roof and has galleries round all its sides, and is covered with a glazed, semicircular iron hipped roof, 58 feet from floor in centre; the rooms at sides are 20 feet 6 inches high, divided from central hall by glazed screens, and extending to the streets bounding sides of site, and a thorough view is obtained from Kent Street to Little Donegall Street.

The first floor contains two large picture galleries, 62 feet 6 inches by 29 feet, and 50 feet by 33 feet 6 inches. The galleries are 23 feet in height to soffit of ceiling, and are added to by the large lantern lights provided. No windows are placed in these walls. The picture galleries have galleries

of communication at ends, so that a complete circuit can be made.

The building is designed for carrying out in stone, the construction, as far as possible, being of a fire-resisting character.

## WESLEYAN CHAPEL, NORMANTON.

ALL the external walls in this building are 20 inches thick of brickwork, walled hollow, and bonded in with iron stays. The facing is of pressed bricks obtained in the neighbourhood. The woodwork will be pitch pine, varnished. The building on the right of the intended chapel is the present school and chapel, and the buildings are joined together in consequence of the site being too narrow to properly detach the chapel and obtain sufficient side light. The total accommodation is for 470, allowing 20 inches for each person, and the works have been let for 1,314*l.* 18*s.*, including front fence walling, iron railing, and gates.

The works are now in hand by local builders, under the direction of Mr. WALTER HANSTOCK, A.R.I.B.A., of Batley.

## DESIGN FOR WESLEYAN CHAPEL, SOUTH CLIFF, SCARBOROUGH.

THIS design was submitted in the recent competition by Mr. WALTER HANSTOCK, A.R.I.B.A. The external walls were to be of the best quality of Yorkshire stone, strong and heavy in construction, and all the arches, columns, chancel, organ chamber arches, &c., in solid ashlar. All internal woodwork to be in pitch pine, and the roof covering in Westmoreland slating.

The greatest novelty in this plan, judging from examples of chapels in the north, is its severe following of the Church of England model, with nave, clerestories, side aisles, transepts, chancel, organ chamber, &c. In the south there are many splendid examples of this type of chapel, but in the north they are either not appreciated or understood by chapel committees, who in most cases have the entire selection of these architectural examples. The accommodation provided is for 582, and the cost about 6,000*l.*

## MODERN ARCHITECTURE.

THE article on "Architecture and Public Improvements" in the *Companion to the Almanac* for 1885 (published by the Stationers' Company), is by Professor T. Hayter Lewis. The following extract will suggest its character:—

Few of the buildings erected in Great Britain during the past year are of exceptional importance, but the general aspect of our cities is being rapidly changed in a very marked manner, as alluded to in the *Companion* of last year. Streets which, a few years since, presented nothing more pretentious than fronts of the ordinary dull brick or cement, set off with a few dressings to the windows, a cornice, and perhaps a balustrade, now furnish examples, which at once arrest attention, of light red-brick fronts, bold dormers, and lofty gables, designed with details of all kinds of style, from the Perpendicular to the Renaissance, and in a large number of cases appearing to have derived their inspiration rather from the Low Countries or the borders of the Loire than from any English type.

However inspired, there can be no doubt that the freedom obtained by such picturesque outlines and colouring as the above have resulted in many designs of great merit and individuality. But, although this has been the case when the work is in strong hands, there is much reason to fear that it will not be so when in weak hands, unrestrained by any special details.

The changes are similar both in London and the provinces. Take Leicester, for example, a good type of a Midland county town, whose great, square, ugly warehouses, and long lines of two-storeyed cottages were fearfully monotonous. But now the high-gabled new buildings in and near the Market Place, Town Hall, &c., give a life and interest to the general aspect of the town which, to those who have not visited it for some years past, affords a pleasing surprise. To accelerate the change, the speculating builder (always keen to note the direction of the public taste) has stepped in, and it may be fairly said that, by availing himself of the aid of skilful architects, he has in many cases produced very successful results, although the high-pitched gables, and the red brick and stone or terra-cotta or coloured concrete of the new work, as contrasted with the horizontal lines and the cemented fronts of the old, hard by, are often somewhat startling.

But other builders are content to rely either on their own skill or their powers of copying, and the wretched details which too often now spoil a design, otherwise good, are likely to be still more debased and more extravagantly varied when the work goes into

inferior hands. In fact, we have even in the drawings in the Royal Academy Exhibition very strong examples of this, showing broken pediments, studiously ugly dormers, strips of thin pilasters without bases, and Italian details of the most emasculated type. And even when the design for a front is good, its effect is completely spoilt when it is repeated house after house in one long row.

For the present these newly-adopted styles have scarcely been successfully used in edifices of large size. One of those—viz. the Leicester Municipal Buildings, already described—although possessing much merit in its several parts, does not present the bold general outlines and imposing mass which one associates with the architecture of the public hall of an important town.

From the accounts hereafter given in detail it will be seen that the designs for municipal and other large civil public buildings have been chiefly in the style which may be termed Classic, or Italian, or Renaissance, according to the severity or the freedom used in its outlines and details; but it must be noted that the term "Renaissance" as now used by architects seems often to have a very different meaning to that which it formerly had, and that employed by Mr. Fergusson, viz. the style used by Inigo Jones at Whitehall. The long horizontal sky-line, little broken except by an extra storey or a tower, is now varied by high roofs, lofty dormers, and massive chimneys, the balustrade (Mr. Ruskin's abomination) being well nigh a thing of the past. In ecclesiastical edifices the architects chiefly adhere to the Pointed styles.

Such, also, is the case with many of the collegiate and other scholastic buildings; but in others this has given place to the use of such mixtures of styles as is seen in, *e.g.* Inigo Jones's beautiful garden front of St. John's College, Oxford, rather than of the Perpendicular work of William of Wykeham hard by.

### THE PARLIAMENTARY COMMITTEE ON WESTMINSTER HALL.

**A**NOTHER meeting of the Select Committee appointed to consider the question of the restoration of the west front of Westminster Hall was held on the 5th inst., Mr. G. Shaw-Lefevre presiding.

Mr. A. S. Ayrton was called by the chairman to give evidence in regard to a statement which had been made by Mr. C. Barry. That gentleman had said that during his (Mr. Ayrton's) period of office, and under his direction, the clock tower of Westminster Palace was finished, or put in its present state, and New Palace Yard was dealt with as it was now to be seen. The fact was that the question of dealing with New Palace Yard was considered by Mr. Cowper-Temple, when First Commissioner of Works, and the conclusion had been come to that it was quite unnecessary for any purpose connected with the use of the Houses of Parliament to complete the quadrangle according to the designs of Sir Charles Barry.

Mr. Shaw-Lefevre: I shall lay before the Committee Mr. Cowper-Temple's answer, therefore it is only necessary for you to state that what was done was not your doing.

Mr. Ayrton: It was certainly not my doing. Mr. Cowper-Temple suggested to me what he was going to do when I was a member of Parliament, and was taking a great deal of interest in these matters. I expressed my opinion to him, and it was certainly entirely in favour of what he was going to do, so far as the abandonment of Sir C. Barry's design for the erection of a new wing in front of Westminster Hall was concerned. What was done by Mr. Cowper-Temple I looked upon as a temporary measure, and as such it was certainly very costly. The present view of Westminster Hall from the higher level of Bridge Street I consider an eyesore, but I have no doubt it could be improved by better treatment.

Mr. Dick Peddie: What would you propose in place of the railings?

Mr. Ayrton: Briefly, I should say that instead of having an iron railing there should be a substantial stone screen erected, architecturally treated outside, and of a certain height, between Bridge Street and New Palace Yard. I would bring the yard to a uniform level. These improvements I should have proposed if the necessity had arisen during my tenure of office. Seeing the inconvenience to which members are put in consequence of there being no waiting-place in New Palace Yard for carriages and horses, and taking into account the changeable nature of our climate, I would have made the inside of the screen an open cloister for use as a stand for these carriages and horses. The screen I propose would afford every accommodation and convenience.

By Mr. Dick Peddie: I always contemplated pulling down the old Law Courts as soon as the new ones were finished and fit for occupation, and so far as the utilisation of the space so rendered vacant is concerned, I do not know that anything better than Sir C. Barry's design could be adopted.

Mr. Shaw-Lefevre here observed that Mr. Ayrton had been called to give an express explanation on a certain point. Of course, if the Committee desired to hear him generally on the proposed restoration it would be competent for it to do so.

The room was cleared, and the Committee remained in private deliberation for some time. On the readmission of the public, Mr. Shaw-Lefevre announced that the Committee had decided not to examine Mr. Ayrton on the general question.

Mr. Pearson, R.A., was then recalled. In reply to Mr. Shaw-Lefevre, he said that in accordance with a suggestion the right hon. gentleman had made to him, he had prepared an alternative plan for dealing with the west front of Westminster Hall. In the new plan he proposed a building under the buttresses somewhat lower than that shown in his original design—a two-storeyed cloister, the effect of which would be to expose the whole of the windows of the Hall and to allow the buttresses to be seen. The building would be 6 feet lower than that in the original plan; it would give a gallery or corridor 8 feet high, and in the upper storey a space 16 feet high, which he had not appropriated to any special purpose. His alternative scheme also included a new building at right angles with the Hall—a building slightly higher than that originally proposed. He still adhered to the whole of his original design, but was prepared to carry out this alternative scheme if it should be the general sense of the Committee. He had read the evidence of Mr. Somers Clarke and Mr. Stevenson, and did not at all agree with it—he certainly did not approve of the alternative plan proposed by them. The building at right angles with Westminster Hall was an essential part of his plan; and as to the proposal to lower the windows of the Hall, his opinion was that it would be very undesirable to do it, and that if it were done no additional light would be obtained owing to the thickness of the wall and the flatness of the sills.

Mr. Ewan Christian stated that he had carefully inspected Mr. Pearson's plans for the restoration and considered them the best that could be made. The buttresses of the wall were in a shattered condition at the present time, and it was of the greatest possible importance that a wall should be constructed such as Mr. Pearson proposed, and such as, no doubt, originally existed. He should call this part of Mr. Pearson's plan "reconstruction" rather than "restoration." They had little evidence as to what the wall was in early times beyond the base and an indication of the height. All the intermediate part was lost, and the design for windows in the plan was, therefore, a matter of conjecture. It was difficult to make a choice between Mr. Pearson's alternative schemes, and although he approved of the lower height of the hall in that produced that day, he should have to think over it for a long time before he said that he preferred the new design to the original one. Looking at the question from an architectural point of view, the reconstruction of the wall was a prime necessity; and if anything was done for the maintenance of the Hall the wall would have to be built between the buttresses. This wall would afford a dignity which the structure in its present state required. He was of opinion that the building at right angles was necessary as a proper finish for the rest of the restoration, and there was clear evidence that a structure of that character had existed in ancient times. Altogether, Mr. Pearson's first proposal for the restoration was a very good one, although it would have been better if it had been a little higher. He considered, however, that to put a very high erection in front of Westminster Hall, shutting in that which was really a grand view of a magnificent structure, would be a grievous necessity. He could not understand how it could be proposed to shut in a handsome monument of this kind, which had played so conspicuous a part in the history of the country, by modern buildings. As for the proposal to put up a trumpery post and pan-work screen before the west front of the Hall, it was simply absurd.

Mr. A. W. Blomfield, F.S.A., stated that he had considered Mr. Pearson's plans, and admired them very much. If the west front of Westminster Hall was to be preserved, some building must be put up before it, and he thought Mr. Pearson's proposal would be much better than a temporary structure of the kind which had been spoken of. Mr. Pearson's was the only plan which would enable them to retain the evidences of the past which still existed in the west front of the Hall.

Mr. Alfred Waterhouse, A.R.A., gave similar evidence, agreeing with previous witnesses that Mr. Pearson had performed the task entrusted to him in the best possible way.

Mr. J. Oldrid Scott, F.R.I.B.A., said that Mr. Pearson's original design was the best, as adhering to all the evidences which remained of the ancient design. There could be no doubt that the original building had been a two-storey one, and had existed before the buttresses. His preference for the first plan was partly on historic grounds and partly on the ground of the superiority of the artistic treatment. There was a good deal to be said in favour of the right-angled building.

Mr. Shaw-Lefevre: Do you think the Hall ought to be as much as possible left open to view?

Mr. Scott: Yes; it is one of the merits of Mr. Pearson's plan that it leaves the west side of the noble old Hall open to view. It is now in a ragged, ruinous condition, but when restored it will be a noble building which no one will desire to have hidden.

Mr. Walter: Do you think the arguments for and against the second plan of Mr. Pearson are pretty nearly balanced from a purely artistic point of view?

Mr. Scott: I do. That plan would show more of the buttresses, and make the view more artistic.

Mr. Walter: Suppose the artistic effect of the second plan is, on the whole, better than that of the original design, and the accommodation better in the latter, would you feel a preference for the second plan?

Mr. Scott: I would not, because we are dealing with an historical building, and I think historical considerations ought to have weight.

Mr. Walter: Would you sacrifice design and beauty, which all people can appreciate to antiquarian value, which can only be appreciated by the few?

Mr. Scott: I should say the value architecturally is very small, as the building will have to be looked upon from a higher level, and would look rather insignificant. Certainly the insignificance will attach only to the cloister and not to the flying buttresses, which are the most striking part of the whole structure.

Mr. James Brooks, F.R.I.B.A., said he approved of Mr. Pearson's original plan, but thought the openings in the lower storey should not be so large by a great deal.

Mr. C. Barry, recalled, stated that since he had expressed his belief that the floor of Westminster Hall had not been raised within the memory of man he had received a letter from a Mr. Adams, some sixty years ago a clerk in the Office of Works or Woods and Forests, stating that Sir Robert Smirk had raised the level of the floor 2 or 3 feet, for the reason that the tide used sometimes to enter the Hall, obliging barristers to use boats to get to the Courts. This was some years before the fire in 1834.

The Committee again adjourned.

#### LIVERPOOL ARCHITECTURAL SOCIETY.

THE annual dinner of the Liverpool Architectural Society, at present in its thirty-seventh session, took place on the 4th inst., the president (Mr. Thos. Cook) being in the chair. The invited guests were the Mayor, Mr. P. H. Rathbone, Mr. Alderman Samuelson, the presidents of the Manchester Society of Architects, the Manchester Architectural Association, the Architectural Societies of Leeds, Sheffield, Birmingham, Nottingham, and Leicester, the Liverpool Engineering Society, the Master Builders' Association, and Mr. J. P. Seddon. From unavoidable causes some of these gentlemen were unable to be present. Among the members of the society present were Messrs. C. Aldridge, Joseph Boulton, H. B. Bare, T. D. Barry, G. Bradbury, C. W. Blease, J. P. Bradley, Thomas Cook, Alfred Culshaw, John Clarke, J. F. Doyle, S. J. Doyle, G. E. Grayson, J. W. Gibbs, C. W. Harvey, F. W. Hornblower (hon. secretary), F. W. Holme, J. M. Hay, E. Kirby, Thomas Mercer, James Montgomery, J. H. M'Govern, E. W. Hobbs, J. Rhind, Thomas Stubbs, Thomas Sheldermine, jun., C. Sherlock, Henry Sumners, W. Tomkinson, T. Wainwright, H. Weightman, C. Wise, A. G. White, J. C. White, &c.

The President, having proposed the usual loyal toasts, gave the health of "His Worship the Mayor."

The Mayor, in responding, referred to his very long connection with the building trade, extending to nearly forty years, and through that with the architects of Liverpool. Among those present he saw Mr. Joseph Boulton, who was one of his earliest remembrances, and whose health he begged to propose. In conclusion he said that the scheme which had been discussed before the society with reference to the establishment of a museum of architectural and sculptural casts at the Walker Art Gallery, inasmuch as it would tend to the advancement of the skill of the handicraftsmen of the city, had his warmest sympathy and approval.

The remaining toasts were "The Architectural Profession, and Success to the Liverpool Architectural Society," proposed by the Mayor and responded to by Mr. Boulton; "Prosperity to the Building Trade," proposed by Mr. Thomas Mercer and replied to by Mr. T. Bromley, president of the Master Builders' Association; "Kindred Societies," proposed by Mr. C. Aldridge and replied to by Mr. John Holden, president of the Manchester Society of Architects, and Mr. R. R. Bevis, jun., president of the Engineering Society; "Art," proposed by Mr. Henry Sumners, and responded to by Mr. Philip H. Rathbone, who strongly advocated the advancement in Liverpool of a collection which should illustrate the best examples of sculptural and architectural detail that it was possible to get together, remarking that it was essential that this should be done, not only from an artistic, but from a political point of view, inasmuch as the supremacy of this country in its manufactures and industries could only be maintained by the production of the highest class of workmanship, which such a school would best promote.

"Our Guests" was proposed by Mr. T. D. Barry, and responded to by Mr. J. P. Seddon, F.R.I.B.A., who expressed the great pleasure he felt in being able to render any service in the direction which had been pointed out by Mr. Rathbone, and he indicated the way in which the school referred to should be established.

The health of the President was next given, and most cordially responded to by all, after which the proceedings came to a conclusion.

#### THE LATE J. A. HOUSTON, R.S.A.

THE Royal Scottish Academy has lost another of its older members by the death of Mr. John Adam Houston, which took place at his residence, Phillimore Place, Kensington, after a long and painful illness. A Welshman by birth, Mr. Houston is understood to have had the advantage of a good education, and his art studies were prosecuted in the Board school, Edinburgh, under the direction of Sir William Allan, and where he had for fellow-students the late Mr. Jas. Drummond and Mr. Gourlay Steell. While yet a young man, he worked a good deal in Switzerland and other parts of the Continent, from which were drawn many of the subjects of his brush. The picture he first exhibited in Edinburgh was a cattle piece, produced in 1833, at which time, having been born in 1812, he must have been twenty-one years of age. From that date onward he was a regular and copious exhibitor, often submitting five or six, and sometimes as many as eight, ten, or even thirteen canvases as his annual contribution. In 1843 he was elected an Associate, and two years later a full member of the Royal Scottish Academy. In 1859 he removed to London, where he has since resided, continuing, however, a loyal supporter of our Academy's exhibitions. As illustrating the character of his practice, mention may be made of *The Bandit's Outlook* and *Don Quixote in His Study*, 1836; *A Fouth of Auld Nicknackets*, a highly characteristic specimen, 1838; *The Herd Boy's Sabbath* and *An Incident of the Crusades*, 1841; *Luther and Melancthon Translating the Bible*, 1843; *The Good Samaritan* (a diploma picture now in the National Gallery), and *The Jew Curiosity Dealer*, 1845; *The Secreting of the Regalia of Scotland*, 1846; *Benvenuto Cellini*, 1848; *The Prodigal Son*, 1849; *A Border Raid*, 1850; *The Fruit Seller*, 1854; *Sancho Panza and the Squire of the Wood*, 1855; *Ophelia*, a very striking picture, 1857; *The Lookout*, 1859; *The Standard Bearer*, 1871; *The Watch on the Moor*, 1872; *The March of Montrose down Ben Nevis*, one of the largest pictures he ever painted, 1878; and *Past Service*, curiously enough, in 1884. He was specially fond of painting pictures of a military character, in the costume of the Elizabethan period, and of the armour of that time, with a view to the filling in of pictorial accessories, he had formed a fine collection. His style was smooth and somewhat artificial; and, alike in landscape and figure painting, he had a predilection for minute detail and careful finish. As a painter in water-colour he held a creditable position among the English practitioners of that art. Mr. Houston is survived by a widow and family.

#### EMPIRICISM IN ART.

TWO lectures have been delivered by Professor Knight, of St. Andrew's University, at the Edinburgh Philosophical Institution, on "Empiricism and Idealism in Literature, Art, and Life." The lecturer said it was his aim to show how the spirit of idealism had found expression in literature and art, and before carrying the principle further, and applying it to some other spheres of human activity, he wished to return to the subject of art. Art in all its sections dealt with the beautiful—not, however, with beautiful things only, in their separateness and fragmentariness, but with beauty in itself, with the beautiful as a unity. According to this doctrine there was nothing essentially excellent or inherently admirable. The difference between what happened to be agreeable and what was in itself beautiful was ignored by sensation. Idealism in art affirmed that there was but one absolute standard of the beautiful which all endeavoured to reach, but to which none fully attained. He affirmed, without fear of contradiction from the competent critic, that there was no art in the eighteenth century worthy of the name; but, when the encyclopædists were supreme dictators in mental science and literature, art became of necessity mechanical and prosaic. Its ideal features vanished; it became formal, technical, rigid, and frigid in its exactitude. The eighteenth was, of all modern centuries, the one in which empiricism distinctively flourished; the period in which idealism flourished most was from the fourteenth to the sixteenth century. Empiricism was always magnifying experience. Let them go to experience and test experience or empiricism in art. Let them go into any modern art gallery—into their own Royal Scottish Academy—and it did not require one to have mastered Plato's philosophy of the beautiful, or to have read all Mr. Ruskin's works interpreting the art of mediæval and modern painters, to be able to tell at once in each year's catalogue what pictures were inspired by idealism and what were not—whether they were landscape or figure paintings. Briefly, in landscape, the most perfect picture was not a mere imitation of nature, or semi-photographic reproduction of it; it was rather a divination of its meaning—a revelation of its latent soul. Pictures such as those by Turner—by far the greatest land-

scape painter that ever existed—were the outcome of idealism or idealistic vision in art. Similarly in portraiture, the most perfect resemblance was not an exact reproduction of the outward appearance of the human face or figure. It was not even a transcript of one particular mood, but is the blending of many different moods into a likeness in which expression was all dominant, and which combined in a unity what the character in question had revealed on many different occasions, and was therefore a true interpretation of the man behind the mask of his physiognomy. If art were the mere imitation of nature, he thought that many would discard it, and would prefer the thing it imitated—nature itself. The truth was that highest art always led through nature to a higher reality that could never be embodied on canvas, or disclosed to any of the senses. Proceeding to deal with the two tendencies in musical art, the lecturer said it was quite true that in music there were not the same sharp lines of contrast drawn as in poetry, or painting, and that in many a sonata, oratorio, or opera even, there was much of both tendencies. The reason perhaps was that music was so delicate and subtle a vehicle for the expression of emotion that there were of necessity mixed effects in almost every great musical creation. After alluding to the two tendencies—idealistic and empirical—on individual and national character, Professor Knight concluded by remarking that each of the two tendencies was essential to the other, and that though often opposed, often in violent hostility and struggle, they were inseparable one from the other, and necessary each to each.

### INTERNATIONAL INVENTIONS EXHIBITION.

THE applications for space have now all been examined by sub-committees of the Council, and a selection has been made of the most promising. The number of applications has been so great that it has been decided to limit very strictly the admissions in those classes which may be considered to have been fully represented in the exhibitions of the present and of the past year. The Council will, therefore, be obliged to refuse many valuable exhibits in such classes as those relating to food, clothing, and building construction. It will even be a difficult matter to accommodate those which have been selected, and it is feared that the list will have to be still further reduced. As soon as possible, information will be sent to those who have applied for space; but the enormous number of applications, far in excess of what was expected, have made it impossible to do this up to the present.

The Guarantee Fund now amounts to 48,280*l.*, a sum considerably in excess of that subscribed for the Health Exhibition, or for the Fisheries, the amount for the former being 26,518*l.*, and that for the latter 26,656*l.*

### THE PROPOSED HISTORICAL MUSEUM IN LIVERPOOL.

A LECTURE was delivered at the Rotunda Lecture Hall, Liverpool, on the 5th inst., by Mr. J. P. Seddon, F.R.I.B.A., on "The Proposed Historical Museum for Liverpool of Sculptural and Architectural Casts." It was illustrated by the oxyhydrogen light.

Sir James Picton presided. He said the circumstances under which they were met were of a very interesting and encouraging character. They were all familiar with the magnificent building in part of which they were then assembled. Most of them were acquainted with its history, how it began from a very small inception and had gradually increased. There had been some opposition, but he was happy to say a great deal of encouragement, and one department after another had been added to it until it had reached its present development. It began, as they were aware, with a library, not upon a large scale. That grew into a museum of natural history. Then came the magnificent Mayer collection of ancient art, and to that was added the Walker Art Gallery and its splendid collection of pictures and artistic associations, and now a further step forward was proposed, and for that they were indebted to their excellent friend, Mr. P. H. Rathbone. They all knew he was an earnest, eager student of art, and had done very much to promote its success in this locality. Mr. Rathbone had taken up a new point of departure. Art consisted not merely of painting, not merely of modern sculpture, but there was a vast field for study and improvement in casts of art of ancient times. Many of those were very precious to lovers of art and those who had studied its history from a large number of them. Many of them had no opportunity of going abroad to see objects of that kind. At South Kensington there was perhaps the most magnificent collection of objects of art, procured from all quarters of the world, and beyond these objects themselves there was a large collection of casts. What Mr. Rathbone had proposed was to obtain as far as they could—not perhaps to the same extent; it could scarcely be expected that could be done—a similar collection upon as large a scale as possible. When they wanted to enlarge the Art Gallery, in consequence of pressure upon their space, from 11,000*l.* to 12,000*l.* was required. That would have had to come

out of the city funds, and he must give credit to the Council that they met the committee very handsomely, and set aside a sum of money which would have defrayed all the expense. Then Sir Andrew Walker came forward nobly and generously, and gave 11,700*l.* to defray the expense of the enlargement of that building. That money having been set aside for the purpose of that erection, it would seem certainly natural and proper that the money should be laid out in a way to promote that institution in its usefulness, and what Mr. Rathbone wished was that it should be applied for this collection of casts, which he had been so anxious to establish. The money which had to be laid out was the property of the citizens of Liverpool, and their opinion on the subject would no doubt have great weight when it came to be discussed in the Council.

### YORK ARCHITECTURAL ASSOCIATION.

THE third session of the York Architectural Association was inaugurated on the 5th inst. by a conversazione in the water-colour galleries of the Yorkshire Fine Art and Industrial Institution. The guests were received by the president of the association (Mr. Arthur Pollard) and the hon. secretary (Mr. B. Priestley Shires).

The President said he regretted that there was not a larger competition for prizes. The successful competitors were as follows:—Class for design and construction—1. Mr. George Henry Nelson; 2. Mr. George Armstrong. Study of perspective—Mr. George H. Nelson. The President, in his address, said that architecture had through all ages been the reflex of the condition and well-being of nations, it having been produced and perfected under the varying conditions of man's life. It had ever spoken accurately of the progress of civilisation, and was therefore undoubtedly history in stone. As man in his primitive state produced primitive dwellings, so as he improved in civilisation his house would assume more perfect form. But it was certain that these improvements made slight progress, requiring ages to produce buildings which would take the form of any decided style which truly described the name of architecture. With the progress of civilisation art gradually acquired an established condition. This, however, usually occurred in metropolitan cities, where there was great pressure of life, conflict of thought, and the highest amount of intelligence. Temples, temple palaces, and religious edifices took the lead in architectural development, and the religious buildings in the early days showed this to be the rule. He then glanced at the architecture of the Egyptians, the Assyrians, the Persians, the Greeks, the Hindoos, the Chinese, and the Italians, and asked—What would have become of ancient Greece and Rome if the Parthenon at Athens and the immortal works of Phidias had been destroyed? The result would have been, he said, that we should have lost half of our knowledge of the intellectual culture of the Greeks. It was their monuments, their sculpture, their temples, and their edifices which had handed down their reputation and glory to our day, and, moreover, from those buildings, step by step, the architecture of Rome and Italy, and indeed every civilised country, had principally come.

### SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE first monthly meeting of the Society of Antiquaries for the present session was held on Monday, Dr. Arthur Mitchell, vice-president, in the chair. The first paper read was an account of some excavations recently undertaken for the Society by Dr. William Traill of Woodwick, in the island of North Ronaldsay, Orkney. The first place opened, a mound at Stenabreck, was found to cover the ruins of an ancient dwelling, consisting of several rooms separated from each other by very thick partition walls, and the outer walls, which were very rude, apparently banked up with earth. The door seemed to have turned on a pivot, and the socket-stone remained in its place. A key made of bone, after the fashion of the wooden keys used for the old Orkney wooden lock, was also found close by the doorway. In several of the rooms there were presses in the wall. The articles found consist chiefly of bone implements and pottery. The other mound excavated, at Howmae, appears probably to cover the ruins of a building of the same age as the brochs. It is an extensive structure, and as yet only a few of the outer chambers have been cleared. They have yielded a large collection of bone implements and pottery, with a few implements of stone. Ground plans and sections of the structures excavated were exhibited to the meeting. Dr. Mitchell, Sheriff Thoms, Professor Duns, and others took part in the discussion that followed. A special vote of thanks was given to Dr. Traill. The second paper was a notice of two vessels of grey-coloured stoneware, styled bellarmine or greybeards, by Mr. John J. Reid. The larger of the two greybeards had a very curious history. It was found filled with quicksilver, and buried in the soil in the island of Fetlar, in Shetland, having been exposed to view by the washing away of the soil after a storm. The smaller of the two was found in digging the foundations of a house at Eyemouth in 1863. They

both belonged to a class of Mediaeval pottery of considerable interest, from its associations as well as from its special characteristics. Among the most ancient remains of Egypt and Greece there was a type of jug not very dissimilar, and Mexico and Peru furnished us with allied specimens. There were allusions in the Roman literature to what are called in the north of England "boggle" drinking-cups; and in our own literature the allusions to such vessels refer to the period of Elizabeth, James I., and Charles I. No doubt, if it were true that these grotesque vessels represented a caricature of the face and figure of Cardinal Bellarmine, the reason of their popularity in this country was obvious. The earlier examples were of much finer workmanship than the so-called bellarmines, which continued to be made in Holland down to a recent period, and are, indeed, now being reproduced in several of the pottery works in Germany from the old designs. An imitation of the old Continental manufacture was made at Fulham in the end of the seventeenth century. The next paper was a description of a cist containing an urn recently discovered at Bruach, Glenlyon, Perthshire, by Mr. Charles Stewart, Killin. The fourth paper was a notice by Mr. J. M. Gow of some stone circles and cup-marked stones on the Hill of Findowie, in Strathbran, Perthshire. The paper was illustrated with drawings by Mr. Gow. The last paper was a notice by Dr. Joseph Anderson of an enamelled cup or patera, found many years ago in Linlithgowshire, and now acquired for the museum. It is a shallow bowl-shaped vessel of bronze,  $4\frac{1}{2}$  inches in diameter and  $2\frac{1}{2}$  inches deep, with a flat handle attached,  $3\frac{1}{2}$  inches in length. Dr. Anderson also exhibited a set of full-sized drawings of five bronze swords, a spear-head, and scabbard-chape, recently ploughed up in Kintyre. The drawings, which were of the actual size of the objects, were executed with great skill and fidelity, and the hoard of bronze objects was one of the most interesting ever found in Scotland.

### THE ROYAL ACADEMY.

THE prizes obtained by the students of the Royal Academy Schools were distributed on Wednesday night by the President. There was a large attendance of members of the Academy and students.

Sir Frederick Leighton said that although the occasion was not one on which the highest honours offered to students by the Academy—namely, the gold medals and three scholarships—were awarded, the members, to whom the general growth and average work of the schools were of even greater importance than the productions of individuals, however brilliant, regarded such celebrations as yielding in no degree in interest and significance to the more showy and striking displays of the alternate years. The general impression of the members of the Academy was that as a whole the competition this year was a satisfactory one. The average standard of merit had been in the majority of classes thoroughly well sustained, and in two or three it had been raised. The members derived special satisfaction from the figure paintings taken from life, for which they had found it necessary to bestow an extra medal. He gave equal praise to the sculptors' competition—the modelling of a figure from life. The progress made by the students in this fascinating art since the establishment of the new school of modelling was, in spite of the inadequate and he hoped only temporary lodgment of that school, such as to afford him the deepest satisfaction. The improvement shown last year in the class of sketch design in modelling had been more than maintained, and here again the Academy had felt bound to make three awards instead of two. The Armitage designs in monochrome for a figure picture were better than they were last year. Nevertheless it was in this class of designing, more especially as applied to mural decoration, that he earnestly hoped yet to see considerable progress. His great desire was to find among the students a keener sense of the decorative properties of art, using the word in its highest sense—a keener appreciation of arrangement in form and of monumental dignity in aspect. With respect to the cartoons of a draped figure he saw this year, as on former occasions, a tendency in a straining after picturesqueness and dramatic incident rather to lose sight of the object for which this competition was instituted, namely, the study of drapery as a mode of expression through form rather than through light and colour. The architectural competition this year was very limited, owing, no doubt, in a great measure to circumstances and arrangements which he, personally, considered regrettable, and which he trusted would not be permanent.

The secretary (Mr. F. A. Eaton) then read the names of the successful students, all of whom were loudly cheered as they came forward to receive their prizes from the President. The list was as follows:—Landscape Painting, Creswick Prize (30%), Ernest Thos. Lingwood. Painting of a Figure from the Life, silver medals, 1st, Arthur John Foster; 2nd, Herbert Sidney Percy; extra, John Ernest Bruen. Painting of a Head from the Life, silver medals, 1st, Thomas E. Garvie; 2nd, Theodora Joan Noyes. Copy of an Oil Painting, silver medals, 1st, not awarded; 2nd, T. Leonard Hughes. Copy of a Landscape, silver medal, Frederick Everett. Cartoon of a Draped Figure (silver medal and 25%), Herbert Sidney

Percy. Design in Monochrome for a Figure Picture, Armitage Prizes, 1st (30% and bronze medal), Chas. Douglas Richardson; 2nd (10%), Joseph L. Davis (who, however, was debarred from actually taking the prize as he won it in 1881). Design for the Decoration of a Portion of a Public Building, prize (40%), Walter Stanley Paget. Drawing of a Figure from the Life, silver medals, 1st, John Ernest Bruen; 2nd, William Hy. Margetson. Set of Six Drawings of a Figure from the Life, 1st prize (50%), Arthur Trivethin Nowell; 2nd (25%), William Hy. Margetson; 3rd (15%), Sidney Paget; 4th (10%), Herbert Sidney Percy (the latter was, however, disqualified, as he received a superior prize in the same competition last year.) Drawing of a Head from the Life, silver medals, 1st, Nelly Erichsen; 2nd, Minnie Jane Shubrook. Drawing of a Statue or Group, silver medals, 1st, William Farran Littler; 2nd, Victor Hobson; Drawing of a Statue or Group, prize (10%), T. Leonard Hughes. Perspective Drawing in Outline (open to painters and sculptors only), silver medal, Fred. Cayley Robinson. Model of a Design, 1st prize (30%), Chas. Douglas Richardson; 2nd (10%), Frederick William Pomeroy; extra (8%), Arthur George Walker. Set of Three Models of a Figure from the Life, 1st prize (50%), Frederick William Pomeroy; 2nd prize (20%), Henry Alfred Pegram. Model of a Figure from the Life, silver medals, 1st prize, George James Frampton; 2nd, Arthur George Walker. Restoration of a Mutilated Antique Statue, no competition. Model of a Statue or Group, silver medals, 1st, not awarded; 2nd, William Henry T. Venner. Model of a Statue or Group, prize (10%), William Goscombe John. Design in Architecture, travelling studentship (60%), Frederick Simpson. Set of Architectural Drawings, silver medals, 1st, Edmund Harold Sedding; 2nd, Henry D. Walton. Set of Architectural Designs (Upper School), prize (25%), J. Attwood Slater. Set of Drawings of an Architectural Design (Lower School), prize (10%), Edward Guy Dawber. Perspective Drawing in Outline (open to architects only), silver medal, Samuel Bridgman Russell. The Landseer Scholarships in Painting and Sculpture, of 40% a year each, tenable for two years, given for the best work done in the examination for passing into the second term of studentship, were awarded to Herbert Sidney Percy and William Toogood.

### THE CITY COMPANIES.

#### 5. The Plaisterers' Company.

THE Plaisterers' Company, which ranks as forty-sixth among the eighty-nine companies, was incorporated by King Henry VII., on March 10, 1501. It was to search, and try, and make, and exercise due search as well in, upon, and of all manner of stuff touching and concerning the Art and Mystery of Pargettors, commonly called Plaisterers, and upon all work and workmen in the said art or mystery, so that the said work might be just, true, and lawful, without any deceit or fraud whatsoever within the City of London, or suburbs thereof. The charter gave power to establish the company as the Guild or Fraternity in honour of the Blessed Virgin Mary, of men of the Mystery or Art of Pargettors in the City of London, commonly called Plaisterers, to be increased and augmented when necessary, and to be governed by a master and two wardens, to be elected annually. The master and wardens and brotherhood were to be a body corporate, with perpetual succession and a common seal, and they were empowered to purchase and enjoy in fee and perpetuity lands and other possessions in the City, suburbs, and elsewhere. And the charter empowered the master and wardens to sue and be sued as "The Master and Wardens of the Guild or Fraternity of the Blessed Mary of Pargettors, commonly called Plaisterers, London."

The Company, under the powers to make examinations, appears to have inflicted fines on offending parties for using bad materials, and for bad workmanship. Search days appear to have been annually appointed up to 1832, but not since, and the company has not exercised any control over plaisterers' work for many years.

Another charter was granted by Queen Elizabeth in 1559, but it has been lost, and there is no record of the contents. The Queen granted a new charter in 1597, which confirmed the privileges of the company, and extended the authority of the master and wardens to and over all persons exercising the art of plaisterers, as well English as aliens and denizens inhabiting and exercising the said art within the City and suburbs and liberties, or within two miles of the City.

Charles II., by a charter dated 1679, confirmed the privileges granted by the previous charters. Having in view the rebuilding of the City, he forbade any person to carry on simultaneously the trades of a mason, bricklayer, or plaisterer, and to exercise or carry on the art of a plaisterer without having been apprenticed seven years to the mystery. The jurisdiction of the company was extended to three miles' distance from the City. On October 19, 1694, the Common Council passed an act compelling all persons using the trade of a plaisterer within the City or liberties of London to become free of the company under penalties.

The Plaisterers do not appear to have restricted themselves to the mystery of Pargettors. In 1579 and 1585 two orders were

made by the Court of Aldermen for settling matters in dispute between the tilers and bricklayers and the plasterers, as to interfering in each other's trades. The observance of these orders was enforced by an order of the Privy Council, dated June 1, 1613, and a general writ or precept issued to the same effect on August 13, 1613.

The Painters suffered from the encroachment of the Plasterers. In the charter of James II. to the Painters-Stainers, we find the following:—

The said Act reciting that the plasterers within the City of London, using nothing but lathing, daubing, plastering, and limeing, did and yet do procure thereby for themselves and their families a convenient living and maintenance; yet not satisfied with that reasonable living, that they do make of their said proper faculties, wherewith and wherein they have been brought up as apprentices, have now of late used and practised the art or mystery of painters-stainers, as well with oil colours as size colours, and that since the making of the said Letters Patents more usually than in former times they have used or did whereby, not only many of the said art or mystery of painters, who have well and honestly as apprentices to the same served for the space of seven years and upwards, and by their labours and industries have attained to the full and perfect skill and knowledge thereof, are not only disabled to get a competent living thereby for the relief of themselves, their poor wives and children, but also that the said plasterers, not having been trained up in the said art or mystery of painting, neither can or do make any such good work or such true and perfect colours as others having been trained up in the said trade as apprentices thereto, and yet utter the same for good and perfect colours, and being no freemen of the painters-stainers, escape therefor unpunished, to the great deceit and abuse of His Majesty's most loving subjects; and whereby the said art or mystery of painting was likely in such sort in short time to decay, as there will not be sufficient workmen of skill in and about the said city to serve in the said art His Majesty, or any other His Majesty's subjects for remedy; whereof it was enacted by the authority of that present Parliament, that from and after the 29th day of September, which was in the year of our Lord God 1606 next after the end of that session of Parliament, no manner of person or persons being or pleading to be a plasterer, or thereafter to become or to be a plasterer, or which should be a servant or sett on work by any plasterer, should use, exercise, or set up the art or mystery or manual occupation of a painter, commonly called a painter-stainer, or any part thereof within the City of London or the liberties or suburbs of the same, or should within the same places aforesaid make any manner of work or works, or lay any manner of colour or colours or painting whatsoever in the said art or mystery of painters-stainers aforesaid, at anytime before occupied or used, unless he or they be or should be the servant or servants, apprentice or apprentices of a painter, otherwise called a painter-stainer, or had served or should serve as an apprentice or apprentices by the space of seven years at the least to a painter-stainer, upon pain that every such person or persons as should or did offend contrary to the true intent and meaning of the said act, should forfeit for every time that he or they should so do or offend, the sum of 5*l.* of lawful money of England. . . . And forasmuch as we are informed that the plasterers in and about the cities of London and Westminster, notwithstanding that in and by the aforementioned and recited Act of Parliament they were allowed to lay and use the six colours in and by the said Act mentioned, and that mingled with size only, and not with oil, and not to make any work or works, painting or paintings, yet they and the major part of them, contrary to the true intent and meaning of the said Act, do with the said six colours, and otherwise by glazing of them over with oil and varnish, work at and exercise the art and mystery of a painter, alias painter-stainer, in divers several works, painting and paintings, and other things properly belonging to the art and mystery of a painter, alias painter-stainer, by means whereof much bad work is made and wrought and which turns to the detriment, hurt and damage of our subjects in general, and particularly to the utmost ruin of the said Company of Painters, alias Painter-Stainers, of our said cities of London and Westminster, the suburbs and liberties of the same, and within six miles compass on every side thereof for remedy whereof, and to prevent the like for the future, and to the intent that the said art or mystery of painters, alias painter-stainers, may be in every respect truly and artificially wrought and exercised, our Royal will and pleasure, is and we do hereby strictly charge and command that no plasterer or plasterers, nor any other person whatsoever do or shall at any time or times hereafter presume to take upon him to work at, use or exercise, the art or mystery of a painter, alias painter-stainer, in any work or in any painting or paintings, or in any other thing belonging to the said art or mystery of painter, or to glaze, oil, or varnish over any work or works made of or mixed with any of the said six colours before mentioned, unless such person hath, or hereafter shall have, served the term of seven years as an apprentice to the said art or mystery, alias painter-stainer, upon pain of forfeiture for every such offence of the sum of five pounds of lawful money of England.

The governing body consists of a master and two wardens (an upper and a renter warden) and a Court of assistants, as directed by the charter. The qualification for membership of the governing body is to be on the livery of the company. The master presides at all meetings of the Court of assistants. The fee now paid by the master on his election is ten guineas. No fee is payable by the upper warden on election. A fee of twenty-five pounds is paid by the renter warden on his election. Each member of the Court of assistants attending a Court receives two pounds.

Any person can become free of the company by redemption, patrimony, or servitude. The grades are "freemen," "liverymen," and "assistants." Women are not admitted to membership. The fees payable on redemption are 5*l.* 5*s.*; by patrimony or servitude,

1*l.* 16*s.* 6*d.* The members of the company are not of any particular trade. About twelve plasterers are members of the company. The qualification for election to the livery is to be a freeman. The Court of assistants elects. Freemen are proposed and seconded by members of the Court. The fees now payable are 30*l.* to the Court, 1*l.* 1*s.* to the clerk, and 10*s.* 6*d.* to the beadle. Only one apprentice has been bound under the auspices of the company during the last ten years.

## THE METROPOLITAN SEWAGE COMMISSION.

THE second and final report of the Commission appointed in 1882 to investigate the system under which sewage is discharged into the Thames has been published. In their first report the Commissioners considered the system itself, and whether any evil effects result from it. The second report is devoted to the measures which can be applied for remedying or preventing the evils.

A *résumé* is given of the attempts which have been made during the past thirty years to solve the problem of sewage utilisation. The conclusion arrived at is that, although the most modern scientific knowledge and experience may be brought to bear on sewage disposal, the solution is a matter of extreme difficulty, and there still exists a popular prejudice against sewage works, which, even if less well-grounded than is generally supposed, must not be disregarded.

The Commissioners have held eighty-one meetings, at which twenty-seven witnesses were examined. Visits were also made to various towns where sewage treatment is practised. But after obtaining the opinions of the best living authorities, and comparing them with the mass of documentary information which has been collected, the Commissioners are compelled to express their regret at the obscurity in which the subject is involved after so many years' study and discussion, and after the large experience that has been gained.

The first question to be considered is the separation of sewage from rainfall. It is one of much importance. If the sewage is to be used on land, or treated chemically, its concentration and uniformity are highly desirable; and if it is to be carried further away by a long conduit, its volume should, from motives of economy, be reduced to a minimum. For these reasons the separation ought to be effected, as much as possible, in future extensions of the metropolitan drainage system.

At one time it was supposed that sewage was a valuable manure, and that the price received for it from farmers or the profits from public sewage farms would be sufficiently large to diminish the taxation of towns. The opinion of experts is generally opposed to that theory. Alderman Avery, who has had a great share in the management of the Birmingham sewage farm, believes that every 7*s.* 6*d.* obtained costs rather more than 7*s.* 6*d.* to produce. At Croydon, in spite of the favourable position of the town and the porous nature of the soil, the loss has been as much as 12,000*l.* a year. Sir Frederick Abel says it is impossible to deal with the sewage in reference to its manurial value. Sir John Lawes considers that nothing is gained by the distribution of sewage to land. At Doncaster four engineers took the sewage farm from the Corporation on a fourteen years' lease. After twelve years' experience, it has been found that the value of the sewage is about 300*l.* a year, or just the cost of the pumping. There can be no doubt that the preponderance of the evidence is against the idea that the sewage of the metropolis can at present be applied by irrigation so as to be a source of profit to the ratepayers. There is still less hope of profit by attempting to extract manure from the sewage by depositing or precipitating processes.

But if the disposal of the sewage is to be undertaken as a necessity, and without much regard to profit, the next question is, what is to be done with it? The most natural way is to apply it to the land as a liquid manure, when the noxious and offensive elements are either appropriated to the crops or are detained in the soil, and are changed into innocuous matter. For this purpose a large area of land is required. According to Sir Robert Rawlinson, 36,500 acres is necessary if the metropolitan sewage is treated on the "broad irrigation." Mr. Robinson estimates the area at 29,000 acres; Colonel Hope at 50,000 to 100,000 acres; Dr. Frankland at 50,000 acres; Messrs. Bidder, Hawksley, & Bazalgette at 95,000 acres; and Messrs. Hoffman & Witt at 100,000 acres. The Commissioners say that later experience has reduced the quantity of land, and it is usual to estimate for broad irrigation one acre to about 100 persons. For a population of 4,000,000 the area required would be about 40,000 acres, or 62 square miles. Whether so much land could be obtained has not been considered by the Commissioners. The land would be costly, and in addition there are the expenses for laying-out the land, for conducting the sewage to it, and for bringing back the effluent to the river.

A lesser quantity of land would be needed if filtration through porous soil could be made the principal instead of an incidental process of sewage treatment. The Rivers Pollution Commissioners have offered several objections to the process. They assert that filtration is wasteful, as not fitted for producing crops,

that the concentration of so large an amount of sewage, on a small area, will produce greater nuisance than any other modes of treatment, that the soil will lose its filtering power, that the cost is too great for adoption, and that the success of the process would be doubtful with ordinary management on a large scale. On the other hand, the Metropolitan Sewage Commissioners consider that the process of filtration has great scientific merit, and offers valuable practical advantages for the disposal of sewage in situations where broad irrigation is impracticable, and where land suitable for filtration can be obtained. It is, however, desirable that the sewage should be previously treated by some efficient process for removing the sludge.

Chemical substances have been employed from time to time to cause speedy precipitation of the sewage. A patent for treating sewage with lime was obtained in 1846, and works for the purpose were established at Tottenham and Leicester. The deposit was made into slabs or "bricks," which were supposed to form a valuable manure. But they were found to be unsaleable, and the proprietors suffered great loss. Many modifications of the system have been attempted, and between 1856 and 1875 over four hundred patents have been taken out. Salts of iron or of alumina; lime, gas-tar, and chloride of magnesium; "black ash waste"; charcoal, blood, and clay are among the precipitants which have been used. The Commissioners say that the adoption of a precipitating process would diminish the existing nuisance in the Thames, and lessen the tendency to deposit foul banks and shoals, although it would not effectually purify the river. The cost is estimated at 200,000*l.* a year.

In Birmingham precipitation is supplemented by application of the sludge to land. The sewage is treated with lime, and allowed to deposit in a series of large tanks; the clarified liquid is then passed through porous land, after which it runs into the river, being found perfectly innocuous. The farm contains about 1,200 acres, and 900 acres are used for the filtration and sludge treatment. The crops produced are above the average, and the land is constantly improving and becoming more fertile. Land and works have cost 400,000*l.*, while the annual expenditure is 49,680*l.* As the income received from the farms is 16,403*l.*, the net annual expenditure is 33,277*l.*, or a little more than 1*s.* 1*d.* per head of the whole population. The Birmingham plan is, according to the Commissioners, one of the most feasible means of solving the metropolitan difficulty.

Several witnesses in the late inquiry have suggested that the most efficient remedy is to remove the outfalls further away from London, and there are two plans for taking the sewage to the open sea. The Commissioners say that it is not expedient that the sewage of the metropolis should be discharged in its crude state into any part of the estuary of the Thames, from the Nore upwards. But if properly clarified by separation of its solids, the sewage might be discharged into the lower part of the estuary below Hole Haven without serious nuisance. Mr. Baldwin Latham says that the only effectual way is to take the sewage straight out to sea and discharge it in deep tidal water, and that it would be cheaper to spend five or six millions on the outfall than to carry out any precipitation process. Messrs. McLean & Stillman and Messrs. Bateman & Hemans prepared plans by which the sewage would be carried to the Essex coast.

The following is a summary of the conclusions arrived at by the Commissioners, and of their recommendations:—

1. The evils described in the first report, as resulting from the present system under which sewage is discharged into the Thames by the Metropolitan Board of Works, still continue, and these evils imperatively demand a prompt remedy.
2. It is neither necessary nor justifiable to discharge the sewage of the metropolis in its crude state into any part of the Thames.
3. Some process of deposition or precipitation should be used to separate the solid from the liquid portions of the sewage.
4. Such process may be conveniently and speedily applied at the two present main outfalls.
5. The solid matter deposited as sludge can be applied to the raising of low-lying lands, or burnt, or dug into land, or carried away to sea.
6. The entire processes of precipitation and dealing with the sludge can be, and must be, effected without substantial nuisance to the neighbourhoods where they are carried on.
7. The liquid portion of the sewage, remaining after the precipitation of the solids, may, as a preliminary and temporary measure, be suffered to escape into the river.
8. Its discharge should be rigorously limited to the period between high water and half ebb of each tide, and the top of the discharging orifice should not be less than six feet below low water of the lowest equinoctial spring tides.
9. By these means much of the existing evil will be abated.
10. The liquid, so separated, would not be sufficiently free from noxious matters to allow of its being discharged at the present outfalls as a permanent measure. It would require further purification; and this, according to the present state of knowledge, can only be done effectually by its application to land.
11. In the case of the metropolis, the best method of applying the liquid to land, with a view to its purification, would be by intermittent filtration. Sufficient land, of a quality suitable for this purpose, exists within a convenient distance of the northern outfall. The liquid portion of the sewage would be pumped up to this land from the separating works, and, after filtration, would be conducted

to the river. Whether suitable land in sufficient quantity can be found in convenient positions near the southern outfall has to be ascertained. If not, the liquid must be conveyed across to the north side by a conduit under the river. If suitable land, in sufficient quantity, and at reasonable cost, cannot be procured near the present outfalls, they recommend that the sewer-liquid, after separation from the solids, be carried down to a lower point of the river, at least as low as Hole Haven, where it may be discharged. In this case it will also be advisable that the liquid from the southern sewage should be taken across the river, and the whole conveyed down the northern side. It may be found that the separating process can be effected more conveniently at the new than at the present outfalls; this will depend on various considerations of cost and otherwise. If the outfalls are removed further down the river, the main conduit or conduits may, if thought desirable, be made of sufficient capacity to include a general extension of the drainage to the whole of the districts round London, as recommended by Sir Joseph Bazalgette and Mr. Baldwin Latham. In new drainage works, the sewage should be, as far as possible, separated from the rainfall.

## LEGAL.

### In the Supreme Court of Judicature—Appeal Division.

(Before MR. JUSTICE MATHEW and MR. JUSTICE DAY.)

#### TEMPORARY ERECTIONS.

This was an appeal, by way of special case, from the decision of Mr. Marsham, the magistrate sitting at the Woolwich Police Court, by the Metropolitan Board of Works, complaining that Messrs. Anthony & Co., of Lonsdale Chambers, Chancery Lane, did on the 15th day of February, 1883, unlawfully erect a movable or wooden erection for the purpose of exhibiting advertisements at the Marquis of Granby public-house, New Cross Road, Greenwich, contrary to 45 Vic. c. 14, s. 13.

After several adjournments owing to illness, the summons was finally heard on May 3 last; the same was dismissed by the learned magistrate on the ground that the erection, having been completed six months before the summons was taken out, the Board were out of time in taking their proceedings under Jarvis's Act, 11 & 12 Vic. c. 43, s. 11.

Against this decision the Board now appealed, Mr. Besley and Mr. Ivory, assisted by Mr. Richard Burton, appearing for the appellants, and Mr. Fox for the respondents.

After the arguments on both sides, the Court decided that the offence was a continuing one, and gave judgment in favour of the appellants with costs. Case to be remitted back to the magistrate to inflict penalties, and the magistrate to take into consideration, in doing so, that if the respondents would undertake to remove the erection the penalties should be mitigated.

#### High Court of Justice.

(Before VICE-CHANCELLOR BACON.)

SHILLITO AND OTHERS *v.* THOMAS LARMUTH & CO.

"THE MANCHESTER GRATE."

This was an action brought against the defendants for infringing the plaintiffs' Letters Patent for grate backs, commonly known as "The Manchester Grate."

The plaintiffs complained that the defendants had infringed their Letters Patent for the invention of "an improvement in grate-backs, for increasing the efficiency of sham register and other firegrates," by the sale of a grate-back under the name of "Rocke's Patent," and they prayed for an injunction to restrain the defendants from selling any grate-backs in infringement of their patent, and from issuing a circular advertising an infringing grate-back under the name of "Rocke's Patent."

His Honour the Vice-Chancellor granted an interim injunction restraining the defendants until the hearing of the action, and ordering an inspection of the grate-backs at the defendants' works.

On Monday, November 24, 1884, the Vice-Chancellor ordered a perpetual injunction restraining the defendants from further infringement, or from issuing the above circular, and ordering them to pay the plaintiffs' costs of the action.

## CHURCH BUILDING AND RESTORATION.

**Islington.**—The church of St. Peter, Islington, erected about forty years ago by Sir Charles Barry, has lately undergone considerable repairs and alterations internally. The floor, which was attacked by dry rot, has been removed, and the entire church has been refloored. The eastern portions of the north and south galleries have been removed, and also the children's galleries in the transepts and west end. A centre and side aisles have been formed instead of two side aisles as formerly. Seats for the choir, with the pulpit and desks, are placed on a raised dais, and the ground floor fitted with open seats. Improvements have been made in the chancel recess and also in the mode of egress; the old

lead lights have been replaced with new windows in geometrical designs glazed with tinted glass. The works have been carried out under the direction of Mr. J. Douglass Mathews, of Dowgate Hill, by Messrs. Dove Bros., Islington. The cost, including lighting and warming, will be about 1,500*l.*, but as the funds in hand do not reach this sum, the external work has to be postponed, and several improvements desired have had to be abandoned.

**Highbury.**—A parish-room for Christ Church, Highbury, has recently been built by Mr. Nightingale, of Lambeth, from the designs of Mr. J. Douglass Mathews, of Dowgate Hill. It consists of a hall to seat 300 persons, with large class-room in rear, and scullery, &c. The interior as well as the exterior is faced with yellow bricks and red brick bands. The roof is open-timbered and boarded, with ventilation-chamber in upper portion. The floor is of wood blocks, bedded on concrete. The gas lighting is by pendant brackets from the hammer beams. The total cost will be about 1,400*l.*

**Bedford.**—A north aisle, which has been added to St. Paul's Church, Bedford, has been opened. The contractor for the work was Mr. A. Kimberley, of Banbury, and Mr. John Day, Bedford, is the architect. The stone and wood-carving has been done by Mr. McCulloch, of Kennington Road, S.E.

**Basingstoke.**—The foundation-stone of a new tower to Ellisfield parish church has been laid. The tower will be square, with an ornamental stone parapet, in the Early Decorated style. It will be constructed of flint, with Bath stone dressings, and will be about 50 feet in height. The work is being carried out by Messrs. J. H. and E. Dyer, of Alton, from the designs of Mr. J. S. Paull, of London.

**Coventry.**—The Company of Cappers and Feltmongers, Coventry, have voted 100*l.* towards the restoration fund of St. Michael's Church, Coventry, and the Drapers' Company have already promised 250*l.* It is hoped that aid may be received from some of the City companies; but the Goldsmiths' Company have reluctantly felt obliged to prefer other applications, though there are, it is estimated, 4,000 people engaged in the local watch trade. It is hoped that it may be reported that the fund amounts to 1,900*l.*, when 1,000*l.* will still be required to meet the conditions attendant upon a local donation of 10,000*l.*

**Brixton.**—A new Baptist chapel has been opened in Acre Lane, Brixton. The building is in the Gothic style, and was erected by Messrs. Higgs & Hill, builders, of South Lambeth. The heating is by Messrs. Jones & Son, Bankside, and the terracotta was supplied by Messrs. Stiff.

## GENERAL.

**M. Paul Baudry** has completed a large painting for the Duc d'Aumale. It is to adorn the ceiling of one of the rooms in the château at Chantilly. The subject is *Mercury conveying Psyche to Elysium*.

**An Art Loan Exhibition** is to be held next January at Norwich, in aid of St. Peter Mancroft Church restoration fund.

**The Studio** of Mr. H. V. Inglis, at Rudgwick, Sussex, has been destroyed by fire. Many valuable works of art were destroyed.

**The Majolica** and other works of art bought by a syndicate at the sale of the Fontaine Collection have (with two exceptions) been repurchased by the Trustees of the British Museum and the Science and Art Department.

**The Bristol University College** is to receive 2,000*l.*, the profits derived from the Industrial and Fine Arts Exhibition lately closed, after being open three months.

**The Russian Government** has purchased the Basilewski Collection, which for many years was to be seen in Paris. It contains 750 examples representing the various schools of industrial art from the second to the seventeenth century. The price paid for the collection was six millions of francs.

**An Exhibition** will be opened in Paris on Monday illustrative of *Le Sport dans l'Art*. The profits are to be given to a charitable society. A large number of pictures have been lent, including works by Cuyp, Snyder, Oudry, Wouvermans, Géricault, Carle Vernet, Décamps, and by many living artists. England will be represented by some works by Landseer and Herring.

**Mr. Henry Perkin** (of the firm of Messrs. Perkin & Bulmer, architects, Leeds), was the designer of the mace which was presented on Saturday to the Mayor and Corporation of Harrogate by the ladies of the town. It is in the Jacobean style, of massive proportions, and has been executed in silver gilt.

**A Memorial Window** has been placed in St. Paul's Church, Burton-on-Trent, as a memorial of the late Mr. M. T. Bass. An oak porch has been erected at the west end of the church from the design of Mr. R. Churchill, architect.

**Messrs. Broughton & Co.**, of Queen Victoria Street, have been awarded a medal at the Health Exhibition for their very useful "Chelsea" patent reversible centre-bit mortise lock.

**An Antique Marble Font**, obtained from Italy, has been presented to Chester Cathedral by Lord Egerton of Tatton.

**Mr. T. C. Horsfall**, on Thursday in last week, delivered a lecture entitled, "What to Look for in Pictures," in the large Picture Gallery of the Nicholson Institute, Leek.

**The Ruskin Museum.**—At a meeting of the Sheffield Town Council on Wednesday, Mr. Alderman Hunter reported that it was very doubtful if Sheffield would be selected by Mr. Ruskin as the recipient of his museum. Mr. Ruskin promised, in writing, to place the museum in Sheffield, providing 5,000*l.* were guaranteed. The money had been promised, and everything done to meet Mr. Ruskin's wishes, but now Mr. Ruskin did not seem disposed to have any communications with Sheffield, and the announcement had been made that the museum was going to Bewdley.

**The Tower of St. Helen's Church**, Abingdon, is to be restored and the spire rebuilt, and the work is to be begun in the ensuing spring.

**The Earl of Home** has promised 1,000*l.* to the building fund of the Edinburgh University Buildings.

**Dr. Waldstein** will deliver three lectures at the Royal Institution on "Greek Sculpture from Phidias to the Roman Era," on the three latter Saturdays in January next.

**The Old Shire Hall of Woodbridge** is being restored under the direction of Mr. Eyton, architect, Ipswich.

**Stained Glass.**—A handsome four-light stained glass window, depicting Scriptural scenes, and with tracery-work, has been erected in St. Luke's Church, Endon, by Messrs. Jones & Willis, of Birmingham and London.

**Dr. Crowden**, head-master of Queen Elizabeth's Grammar School at Cranbrook, has offered to give a donation of 1,200*l.* towards the building fund of the school, in addition to the 1,400*l.* which he has already raised by subscriptions, on condition that the central block of buildings designed by the architect be completed. The Governors have accepted his offer, and the remainder of the works will be proceeded with forthwith. The buildings are designed by Mr. T. G. Jackson.

**Home for Female Inebriates.**—The foundation-stone for the extension of these premises, which are situated at Ebenezer Terrace, Kennington, was laid on Wednesday last by Mr. Samuel Morley, M.P. The object sought is, by building a commodious steam laundry, to endeavour to make this institution for the reform of drunkenness self-supporting. The architect is Mr. Banister Fletcher.

**Saltwood Castle, near Hythe**, the ancient palace of the archbishops of Canterbury, has just been restored for residential purposes by the owner, Mr. W. Deedes.

**The Committee** of the Paisley Liberal Club have purchased from the Corporation for 3,300*l.* a piece of ground at the corner of High Street and Churchill, Paisley, as a site for the new club, which is to cost over 10,000*l.*

**A Japanese Inventor**, named Sakashita, of Wasima, is said to have discovered a means of making a paper from marine plants. It is thick in texture, and from its transparency can be substituted for glass in windows, and when coloured becomes an imitation of stained glass.

**The Commission** for the Paris Universal Exhibition of 1889 have decided that the Champs de Mars should be the site of the principal exhibition. Simultaneously a so-called "Labour Exhibition" is to be held at Vincennes.

**Messrs. Chubb & Sons** have obtained the Fothergill gold medal from the Society of Arts, for the best exhibit in Class 27 of the International Health Exhibition. The exhibit consisted of Chubb's patent fire-resisting doors, which have previously obtained the only gold medal awarded by the exhibition jury in the class for fire-prevention apparatus.

**Messrs. Kirk & Randall** have undertaken to complete the building of the new workhouse for the Wandsworth and Clapham Union, of which Mr. Aldwinkle is the architect.

**Five Stained-Glass Windows**, by Messrs. Clayton & Bell, have been placed in the chancel of All Saints Church, Cairo, in memory of the soldiers who fell in the Egyptian campaign of 1882.

**The Belfry Arch** of the Saxon tower of Earl's Barton church now being restored by Mr. J. Harris, contractor, of Earl's Barton, under the direction of Mr. Pearson, R.A., has been completed. In opening windows in the west of the tower, which have been built up for a great number of years, three windows were found, the lower one being 4½ feet deep by 20 inches wide. The other two are "bull's eyes," and measure about 18 inches in diameter. The whole of the stonework in one of the windows is in good order, and they are further proofs of the antiquity of the tower.

**The Directors of the East Southsea Pier** contemplate improving the structure at a cost of over 8,000*l.* It is intended to extend the pier seaward by 90 feet, to construct a landing-stage of wrought-iron for steamers to come alongside at all tides, to lengthen the pavilion by 40 feet, and cover the whole with a glass roof.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, DECEMBER 13, 1884.

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested, that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”*

### COMPETITIONS OPEN.

FALMOUTH.—Dec. 24.—Plans are required for the Erection of Wesleyan Sunday School Premises, with Class-rooms, &c. Mr. F. L. Earle, Falmouth.

KING'S NORTON.—Jan. 15.—Plans for the Erection of Four Cottage Homes upon Lands situate at Shenley Fields are required. Mr. Ralph Docker, Clerk of King's Norton Union, Colmore Row, Birmingham.

KING'S NORTON.—Jan. 15.—Plans are invited for the Erection of a Laundry, at the Workhouse, Selly Oak. Mr. Ralph Docker, 57 Colmore Row, Birmingham.

### CONTRACTS OPEN.

ASPATRIA.—Dec. 20.—For Building Oil-house, Granary, Coal-house, Hay-barn, Shop, Slaughter-house, and other Buildings. Mr. Henry Cooper, Co-operative Stores, Aspatria.

BANGOR.—Dec. 17.—For Building Laboratory and Lecture-room. Mr. W. C. Davies, University College, Bangor.

BELFAST.—Dec. 15.—For Building Goods Shed, Donegall Quay. Mr. W. Currie, Harbour Office, Belfast.

BELFAST.—Dec. 18.—For Heating Post Office. Mr. W. B. Soady, Secretary, Office of Public Works, Dublin.

BILLESDON.—Jan. 2.—For Building Additional Vagrant Wards at the Workhouse. Mr. Bird, Surveyor, 16 Hum-berstone Road, Leicester.

BIRKENHEAD.—Dec. 15.—For Building Ward at Fever Hospital. Mr. T. C. Thorburn, Borough Surveyor, 35 Hamilton Square, Birkenhead.

BRADFORD MOOR.—Dec. 20.—For Building Four Houses. Mr. William Ryecroft, Architect, 12 Bank Buildings, Man-chester Road, Bradford.

CHATHAM.—Dec. 24.—For Construction of Iron Pier on Site of existing Sun Pier on the Medway. Messrs. Law & Chatterton; C.E., 46 Queen's Anne's Gate, Westminster.

CROSS HILLS.—Dec. 22.—For Building Six Houses at Sutton Mill, and Construction of Sewer. Mr. S. Jackson, Architect, 33 Kirkgate, Bradford.

CUCKFIELD.—Dec. 23.—For Additions to National School Buildings. Mr. F. W. Holloway, Architect, Hayward's Heath.

CUPAR, FIFE.—Dec. 15.—For Water Supply Works to Craigrothie House and Offices, Parish of Ceres. Mr. David Storrar, C.E., Cupar, Fife.

DARLSTON.—Dec. 18.—For Construction of Ten Miles or thereabouts of 18-inch, 15-inch, 12-inch, 10-inch, and 9-inch Earthenware and Cast-iron Pipe Sewers, and Con-struction of Engine and Boiler-house, Cottage, Tanks, Filter-beds, Drains, &c. Mr. Edward Pritchard, C.E., 2 Storey's Gate, Westminster, or 37 Waterloo Street, Birmingham.

DARLINGTON.—Dec. 18.—For Building Hind's Cottage. Messrs. Clark & Moscrop, Architects, Feethams, Darling-ton.

DONCASTER.—Dec. 22.—For Building Church or Church school at the Holmes. The Secretary, Holmes Church Committee, Mansion House, Darlington.

DURBAN.—Dec. 15.—For Supply of Cast-iron Water Pipes (1,000 tons), &c. South African Mercantile Agency, 9 King William Street, E.C.

DYONISIDE.—Dec. 26.—For Building Board Schools, Mr. W. Yates, Clerk to the School Board, Distington.

HALIFAX.—Dec. 15.—For Improvements at Free School Lane, Brick Sewer, Fencing, Walling, &c. Mr. Escott, Borough Engineer, Town Hall, Halifax.

HERTFORD.—Dec. 19.—For Alterations to Assize Courts Shire Hall. Mr. Urban A. Smith, County Surveyor, Hert-ford.

HOLLINWOOD.—Dec. 23.—For Building Retort-house, Shed, and Chimney. Mr. H. Andrew, Gas and Water Offices, Oldham.

HUDDESFIELD.—Dec. 18.—For Enlargement of Pas-senger Station. The Engineer, Euston Station, London.

KENDAL.—Dec. 30.—For Building Tower, Crosthwaite Church. Mr. J. Bintley, Architect, 7 Lowther Street, Kendal.

KING'S NORTON.—Dec. 16.—For Laying Sewers, King's Heath and Greenhill. Mr. Robert Godfrey, Surveyor, King's Heath.

LEEDS.—Dec. 13.—For Taking Down and Rebuilding Chapel. Mr. J. Howdill, Architect, 4 Park Lane, Leeds.

LEEDS.—Dec. 16.—For Building Warehouse. Mr. Wm. Bakewell, Architect, 38 Park Square, Leeds.

LEEDS.—Dec. 19.—For the Finishing Contracts, Boar Lane Restaurant. Mr. C. S. Nelson, Architect, Albert Chambers, Park Row, Leeds.

LONDON.—Dec. 15.—For Fittings for Central Technical Institution. Mr. Alfred Waterhouse, A.R.A., 20 New Cavendish Street, W.

MIDLAND RAILWAY.—Dec. 22.—For Building Boiler-house and Chimney Shaft, Derby. Mr. A. Langley, Engi-neer, Midland Railway, Derby.

NEWARK.—Dec. 17.—For Building Shop and Premises, Market Place. Mr. George Sheppard, Architect, 9 Kirk-gate, Newark.

NEWCASTLE-ON-TYNE.—Dec. 15.—For Constructing and Fitting-up Public Baths and Washhouses. Messrs. Gibson & Allan, Architects, 3 St. Nicholas' Buildings, Newcastle-on-Tyne.

NEWLYN.—Dec. 13.—For Construction of Concrete Pier. Mr. J. C. Inglis, Engineer, 13 Buckland Terrace Plymouth.

NORHAM.—Dec. 15.—For the Supply and Erection of a Wrought-iron Bridge over the River Tweed. Mr. H. F. Sneyd-Kynnersley, Surveyor's Office, Moot Hall, New-castle-on-Tyne.

NORTHALLERTON.—Dec. 17.—For Building Station-master's House at Danby Wiske. Mr. William Bell, Archi-tect, York.

NORTH SHIELDS.—Dec. 20.—For Building Keeper's Lodge and Stable for Cricket Club. Mr. H. Gibson, Architect, 101 Howard Street, North Shields.

OPORTO.—Dec. 15.—For Construction of Covered Market. Senor J. A. Correa de Barros, President of the Municipal Board of Oporto, Portugal.

PEEL.—Dec. 23.—For Taking Down Wooden Drill Shed, Battery, Magazine, and Latrines at Barrow-in-Furness, Removing and Re-erecting at Peel. Director of Works Department, Admiralty, 71 Spring Gardens.

PORTSMOUTH.—Dec. 13.—For Building Inland Revenue Office. H.M. Office of Works, 12 Whitehall Place, S.W.

RAMSBOTTOM.—For Building Pair of Semi-detached Villas, near Irwell Mount. Messrs. Sellers & Hamilton Architects, Union Chambers, Bury.

RASTRICK.—Dec. 17.—For Additions to Common School, Warming, &c. Mr. R. F. Rogerson, Architect, 11 Church Street, Brighouse.

SHIELDS.—Dec. 15.—For Erection of Station Buildings, Waiting-rooms, Booking-hall, &c. Drawings at the Engineer's Office, St. Enoch Station, Glasgow.

SMALLBURGH.—Dec. 15.—For Repairs and Drainage Works at the Workhouse. Mr. J. B. Pearce, Architect, Surrey Street, Norwich.

PRIMROSE & CO. CHURCH ST. SHEFFIELD. ECLIPSE PATENT ROOF GLAZING NO PUTTY, PAINT, ZINC OR OTHER PERISHABLE MATERIAL. IN EXTENSIVE USE FOR RAILWAY STATIONS, MILLS, &c. Exhibition, 1884.

GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"SIR,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it.

"Yours, &c.

"JAMES WEIR, F.R.I.B.A.

"To Mr. Grundy."

"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools in  
course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public.

"Mr. John Grundy."

# The Architect.

## GOTTFRIED SEMPER AND HIS THEORY OF ART.

WE have the authority of BACON for the belief that distilled books are "flashy things." Nevertheless it is an advantage to be able to comprehend the spirit of an author, and, if the writings are voluminous, that is not possible for the majority of people who lead busy lives unless they are aided by abstracts. The summary of Mr. RUSKIN's writings which was read at the Institute of Architects a few years back was found to be most useful; and the paper on SEMPER by Mr. LAWRENCE HARVEY, of which a part was

heard at the meeting on Monday, cannot fail to secure equal attention. As everybody knows, Mr. RUSKIN is a writer who can give attractiveness to political economy or mineralogy. SEMPER, on the contrary, was indifferent to literary style. He said plainly that he did not covet idle readers, and his books are in such a form as to need no small courage in a reader who undertakes the thorough study of one of them. There is no translation in French or English of SEMPER's principal work—on style in art. An essay of his is occasionally found in a French periodical, such as the *Revue des Cours Littéraires*, but we may seek in vain for a reference to him in an English review or magazine. The public can only judge of his opinions from the extract which was printed in one of the handbooks to the Crystal Palace.

It is not, however, an advantage that his writings should so soon fall into oblivion in England. SEMPER was one of those men who are able to excite thought, and therefore his books are more valuable than others which may contain later information. Even his errors have their use. The one volume on Style, which is all that has been printed in Germany, is employed in the fine art classes of the Edinburgh University (where alone in Great Britain a systematic course of instruction in the history of art is to be obtained), and in the hands of a capable professor there is no more suitable book. Let us hope that the Science and Art Department by obtaining a condensed translation of it will enable art students to understand SEMPER's theories. In doing so the reputation of one of the earliest officers will be extended.

SEMPER was among the refugees who fled to England in consequence of the revolutions of 1848. By martial law he was guilty of treason, for, while an official architect in Dresden, he gave directions to insurgents about the construction of a barricade. But he was not a conspirator. If he had been he was not likely to secure the protection of Prince ALBERT. Indeed he owed his escape from Dresden to the exertions of the English ambassador. When the central school for general and special instruction in art was established at Marlborough House in 1853, SEMPER was appointed to be one of the teachers. He had charge of "Practical Construction, including Architecture, Building, and the various Processes of Plastic Decoration, Furniture, and Metal Working," a division that was sufficiently extensive for one man's supervision.

SEMPER's position was not enviable. The technical courses were no more than an experiment. They were "intended to impart systematically a knowledge of the scientific principles of art, especially in its relation to the useful purposes of life," but it was by no means decided what those principles were. Mr. REDGRAVE, the art superintendent, had his own theory about them; so had Mr. WORNUM, the librarian; Mr. OCTAVIUS HODSON, the lecturer on surface decoration; Mr. J. C. ROBINSON and Mr. SIMPSON, who taught pottery painting; and Mr. OWEN JONES, who occasionally gave lectures. Mr. HENRY COLE, who was one of the secretaries, had likewise his notions about art and life. Among all those improvised authorities SEMPER alone was recognised as Professor; but his influence was circumscribed. He was a *protégé* of the PRINCE, and accordingly was regarded with suspicion by some; to others he was the dangerous Continental revolutionist. SEMPER had a high opinion of himself, and was accustomed to more despotic powers than were admitted in Marlborough House. The grants in those days were niggardly, and he could not under-

stand the difficulties of obtaining examples for his class. His students were not selected for ability, yet it was with their aid he was expected to produce a WELLINGTON Funeral Car, and it was for their crude plaques that he had to design a setting in the form of a cabinet or other piece of furniture. Little was cared for theory in an institution of which the School of Mines was a branch, and poor SEMPER revelled in speculations. He expressed himself in English with difficulty, and we fear that when he did so he was considered a bore. Any man who believed that the "blessed word Mesopotamia" expressed the name of the paradise from whence all art was derived, and who asserted that SENECA was the safest guide in the conduct of life was never likely to become respected as a practical man in England. SEMPER had gained long before a reputation as one of the first architects in Germany; but what English official would consult him on any matter relating to architecture when Captain FRANCIS FOWKE, R.E., was about the premises? It is not surprising that SEMPER seized the first opportunity to return to the Continent. We may assume that his departure did not excite much grief among his colleagues.

It has been claimed for SEMPER by Mr. HARVEY, that he was the first among the moderns to enounce the theory of evolution, having been inspired by his philosophical master SENECA. That position might be disputed; but SEMPER has been at least the first among modern artists who has expressed the theory in words. It is hardly necessary to say that every man who had studied the history of painting, sculpture, or architecture must have gained an idea on the subject which would correspond more or less closely with the theory.

SEMPER maintained that the origin of the fine arts is to be found among technical arts of a humble kind, and in reducing them to a simpler state he did not restrict himself by the present use of materials. Thus, for example, he considers that primitive carpentry was the originator of forms which may now be produced in stone; that, inasmuch as tile pavements may have been suggested by carpets or matting, there is a relation between textile and ceramic art, and so of other arts. Since textiles are the oldest production of technical art, it may be concluded, he says, that modern arts are directly or indirectly derived from weaving, sewing, and embroidering. Gothic art, according to SEMPER, put the bones outside the skin; but, speaking generally, all other forms of art are recognitions of the principle of covering one material with another that is more agreeable to the eyes, or, as we express it, that the clothes philosophy prevails in art as well as in morals.

It has been suggested that CARLYLE's first book, "Sartor Resartus," is a skit on this system, and that TEUFELSDROCKH, who lectured on things in general in Heaven knows where, was a portrait of the architect-professor. But there is no evidence to support this belief. SEMPER's essay does not appear to have excited much interest in Germany on its appearance, and it is most unlikely that a copy could reach CARLYLE in Craigenputtock. Besides, it is well known that inspiration for the "Sartor" and other writings was drawn by CARLYLE from the doctrine of FICHTE, which dates from the end of the last century. According to it, all things which we see or work with are no more than a kind of vesture. May we not suppose that SEMPER, like CARLYLE, was indebted to the German transcendentalist? But a much older source was open to the scholarly SEMPER, who was at home in the classics. What is the meaning of the despised Aristotelian category which is translated as "habit" but a suggestion of a difference between outside and inside, between a thing and its external wrappings? The Greek dialectician must have observed that in many things which were the product of man's hands there was an inner core and an external covering. In the case of statuary there was drapery or thin plates of metal. From this appearance his thoughts were carried to life in general, and he drew the conclusion that one thing can be contiguous to another without being united in vital continuity. SHAKESPEARE, while in a cynical mood, came to the same conclusion. He tells us that—

The painting is almost the natural man;  
For since dishonour traffics with man's nature,  
He is but outside.

The clothes philosophy is therefore of older date than SEMPER, and, indeed, no man could apply a plate of metal, a slab of marble, or a coat of paint to materials of a different kind without having a conviction of such a principle.

If we accept SEMPER's theory, it will follow from it that

conventional art has had precedence of imitative art. The crossing of threads, stitches, seams, and so on are supposed to be suggestive of repetition, rhythm, and other elements of ornament. But how does the historical evidence support this view? SEMPER lays much stress on what is found in Assyria and Egypt. It is, however, true that since he wrote, ornament has been discovered of an age that makes the oldest Assyrian or Egyptian work seem to be modern productions. The sketches of reindeer which have been found scratched on bones by the wild cave-dwellers are sufficient to show that man was an imitative artist before he took to conventionalising needlework. Collections of prehistoric art suggest the same conclusion. If we must start from the source of art it is as well to be correct, and go back sufficiently far. In SEMPER's time there was little known about anthropology as a science, and it was premature to build up theories on the origin of art. Judging by the revelations which are constantly being made, it may be said that we are not in a position to write the history of England during the last three centuries, and in all countries the works of historians have to be superseded. It is still more difficult to philosophise on the art-history of the human race.

Unless we are mistaken, GOTTFRIED SEMPER was one of the last men who should have undertaken the history of art. Thinkers may be divided into two classes. The first class uphold necessity, and maintain that truth must be single. Hence they advocate the adoption of rigid rules in art and literature. The second class believe in liberty and individualism, and allow as many kinds of art and literature as there are artists and writers. SEMPER belonged to the former, and was a rather intolerant representative of it. He would have everything assume a certain definite form, or, in other words, he would apply the laws of crystallography to painting, sculpture, architecture, and ornament. He read the history of art by the aid of logic, and interpreted forms as if they were inevitable products of a mental action that was mechanical in its working. If the Egyptian priests covered the walls of a temple with squares in order to block out their conventional figures, it was because some primitive women had used coarse canvas for embroidery. If a painter adopted the rules of composition, and kept his figures from straggling, he was indebted to the use of scarves some thousands of years before. If a writer like DE QUINCEY takes care to unite his sentences, so that the second relates to the first and the third to the second, it is owing to the fact that an unknown savage strung beads on a string. SEMPER's theory, if followed out, leads to conclusions like the foregoing.

It is, we admit, a fascinating task to seek after the process employed by a great artist or a great writer; and, as HAMLET says, "to pluck out the heart of the mystery" which inspires genius. Even alchemy cannot be more exciting. But, although perseverance is rewarded by occasional discoveries, complete success is unattainable. No man has done more than SEMPER in that line. He believed that he had found what might be called the Philosopher's Stone of Art, but if so, why was he unable to employ it? His buildings are, we suppose, theoretically faultless, if judged by the laws which he had evolved, but with all respect for the designer it must be said that the majority are not pleasing examples of architecture. The proportions are determined by rule, the details are correct, everything is in its proper place; but there is nothing which suggests an inspiration, and nothing which is attractive. They are precisely the kind of buildings which might be cast or turned out of a machine. They are examples of a rigorous logic and a faultless geometry, and are correspondingly chilling.

SEMPER had a surprising power of finding resemblances between things, and on that account his writings are useful to students. They enable one to observe. But a recognition of differences is also necessary if we wish to gain a complete knowledge of forms or processes, and in that respect SEMPER was rather defective. Let us, however, be grateful for what he has done. SEMPER is one of the very few artists who have attempted to form a theory of art, and it is not impossible that if occasionally he is too definite in his conclusions, it is because he rebelled against the nebulous speculations concerning art which came from his visionary countrymen. An earnest student can make good use of SEMPER's writings, whether he will consider them to be infallible is another question. Meanwhile the thanks of the members of the Institute are due to Mr. HARVEY for the great labour he has gone through in compressing SEMPER's big volume within the limits of an ordinary paper.

## THE ART OF MR. J. D. LINTON.

THE test of a general exhibition-room has been held to put an artist on his just level, very much as the ordeal of a public school is supposed to try the power of a lad to "hold his own." And in a certain sense this accepted notion is correct: there are qualities of artistic attainment, such as mastery of technical means, character in style, force, which are gauged by juxtaposition with the various work of other men. But, on the other hand, the finer, more delicate attributes of a true artist may be overpowered by discordant surroundings, and the most blatant performances of mediocrity serve to hinder the appeal of a TURNER or a MULREADY. Painting up to exhibition pitch, as it is called, becomes an absolute snare, and many an artist arrests the development of his best perceptions and individual capacities by a determination to be at all events seen and noted in spite of the hubbub. Exaggerated mannerisms, coarse colour, cheap effect—these are the unwholesome results of "exhibition pitch" with men not sufficiently possessed by an ideal standard to resist the temptation to attain popular remark at any price.

Possibly it is the reaction against all this among thoughtful people, painters and amateurs, that has swayed the fashion of exhibition organising in the direction of special collections. Certainly the number of these exhibitions, illustrating the work of one or of two men, has greatly increased of late. Within the winter programmes of the Royal Academy the plan has resulted admirably in the honourable recognition of British painters who died within the century. Now our living contemporaries come forward to claim the same chance of appreciation, and the Fine Art Society has assumed the lead in arranging special gatherings within its Bond Street galleries. By the time an artist reaches middle life he has thrown off a great deal of good work that the public has had time to forget, and to assemble together the principal results of his art career is to make out the strongest case for his claim on present and future fame.

The last painter thus prominently placed before us is Mr. J. D. LINTON, by whom some fifty to sixty oil pictures and water-colour drawings have been collected in the larger rooms of the Fine Art Society, and catalogued and commented upon in an appreciative and discriminating way by Mr. WALTER ARMSTRONG. This show of pictures, by an artist of so much distinctive and attractive power as Mr. LINTON, serves to illustrate very well the advantage and disadvantage of these special exhibitions as against the rough competition of the open galleries. When placed among a motley crowd the pictures of this artist tell by contrast of their dignified romantic vein, their emphatic, if unimpassioned narrative, their nobility of colour and sumptuousness of beautiful detail; still more by a certain breadth of manner, often combined with a deliberate finesse of execution. On the other hand, grouped together without foil or opposition, a certain monotony of pleasure in superb costume, a certain repetition of chosen models, a certain immobility of dramatic presentation, as of scenes personated in *tableaux vivants*, are apparent. We see that the single figures, studied under the characters of WALTER SCOTT'S *Earl of Leicester*, *Darnley*, *Peveril of the Peak*, *Alice Bridgenorth*, and what else, are indeed to some extent specific personages, but are much more sufficiently typical models upon whom to cast, in a way wholly suitable to them, splendidly worked-out costume coloured upon a definite scheme. *Leicester* presents a singularly cunning study of white taffety; *Janet Foster* is worked out in dusky sapphire greens; *Darnley* is an apt case for a harmony of black and gold; and *Peveril* pranks it in one of the noblest crimson-red doublets that ever gallant wore. Costume is not a frivolous excuse for handicraft with Mr. LINTON, but a serious matter worthy closest care and elaboration. He does not exactly hold that the clothes make the man, but he forces us to feel that clothes are so characteristic of race, manners, and epoch that in them history is writ plain.

On the whole, this exhibition serves to pronounce the fact that Mr. LINTON is primarily a worker in the water-colour medium. His happiest compositions—*The Admonition*, *Love the Conqueror*, *Ave Maria*, *Maundy Thursday*, *Off Guard*—are in water-colour, and in these and in *The Cardinal Minister*, and in single figure studies in the same vehicle, is to be found also his best work as a colourist. The five large oil pictures illustrating the career of a soldier of fortune in the sixteenth century, designed to adorn the smoking-room of a private

mansion, all of which have been exhibited at the Academy and Grosvenor Galleries, and received criticism in these columns, though so cleverly cast between the decorative and the actual, though abounding in passages of harmonious colour and rich detail, though not wanting in a narrative of sufficient dignity and interest, yet do undoubtedly, and in spite of more ambitious scale and more overt appeal, sink beside the indubitably greater art of the water-colour work. This would not have been the impression left on our minds had we only seen these oil efforts in Burlington House and the Grosvenor Gallery; and it is an advantage of this special exhibition that it tries the artist's most ostentatious endeavours by the standard he himself has raised.

On the whole we recognise this art of Mr. LINTON as of the most soundly original among us. Based, as Mr. ARMSTRONG very well observes, upon study of both Venetian and Netherlandish schools, it shows a picturesque individuality in the combination that indicates the painter is no copyist. He may fail of the opulent life of Venetian art, he has not attained the precision or the *chiaro-oscuro* of the Northern masters of technique. But we may be proud of him as a virtuoso in the modern medium of aquarel, who has worked out in it some of the noblest problems of colour, and enriched the narrative art of the day with inventions of historic dignity created in a vein of genuine and manly sentiment.

### MACHINERY AT THE SMITHFIELD CLUB CATTLE SHOW.

THE annual recurrence of the Cattle Show at the Agricultural Hall, Islington, brings together a collection of machinery such as is seldom seen in London except on those occasions. True, by far the larger portion are implements and machines for agricultural purposes; but the traction and portable engines, of which there are generally numerous examples, are nowadays in as much demand by the contractor and builder as by the agriculturist. Many of the large firms who have won so much honour as makers of agricultural machinery supplement their output by the manufacture of mortar-mills, saw-benches, and similar appliances, by which they appeal to the building trades. Although exhibitions of all kinds are generally considered very "elastic," there are none much more so than the Smithfield Club show. In tracing the gradations between the different exhibits it is comparatively easy to show a connection between this or that, and so effect a kind of connecting "sliding scale" with all; but if we select the lowest in the scale and compare it with the highest the difference is immense, and since last year it has been even more marked. The desire to obtain space in the Islington Hall on the occasion of this annual exhibition has been so great that refusals to applicants have been imperative, and to meet this growing demand the company, about two years since, erected a range of galleries over the entrance or vestibule, which at the last two shows have also been filled with a plethora of miscellaneous productions; and such is the craving for publicity on the part of many firms at the Cattle Show, that it is probable that more room will be needed. At this year's exhibition, that closed on Friday night, last week, the display was of the usual character, and we have selected those exhibits for remark that appear to us most likely to interest our readers.

The ST. PANCRAS IRONWORKS COMPANY were, as usual, well represented. The stable and cowhouse fittings made by this firm are so admittedly good that detailed description is rendered unnecessary. An improved feature was exhibited in cowhouse fittings with a vertical fodder-rack, as originally made for the Duke of Bedford's farm at Woburn. Another noticeable fitting was one designed for heavy draught horses, of massive character, and containing the most recent improvements.

To ordinary appearance there is so much in common with most traction and portable engines, that it seems invidious to make distinctions in many cases; still, there are certain firms who have gained a reputation for these machines that places them in the front rank as manufacturers of them, and in this category we may mention Messrs. ROBESY & CO., of the Globe Works, Lincoln, who exhibited an improved seven horse-power traction engine, with a steel boiler and complete gearing of the same metal, winding-drum, steel-wire rope, &c. Another good engine shown by this firm is a six horse-power portable, with a steam-jacketed cylinder, expansion gear, and feed-water heater, arranged to provide great economy in the consumption of fuel. A ten horse-power "Robesby" semi-portable engine, with locomotive boiler, was an excellent specimen of workmanship, and was fitted with all the firm's latest improvements, tending to economy in fuel, safety in use, &c. In addition to the above-noted were several vertical engines and boilers, admirably adapted for the builder's use, and of their horizontal fixed engines, all of which exhibited good finish and workmanship.

Messrs. MARSHALL, SONS & CO., Limited, of Gainsborough, were also well to the front in engines, in the manufacture of which they are probably not excelled, at least of the types of which we are treating. The principal feature in their exhibit in this department was a newly-designed compound portable engine of 16 horse (nominal) power. It was of massive construction, exhibiting considerable strength in all its parts, and will work at a pressure of 140 lbs. to the square inch. High and low-pressure cylinders are of one casting, and with a base allowing of an extended bearing surface on the boiler, which insures great rigidity in working, patent automatic expansion valve gear being fitted to the high-pressure cylinder. The boiler is like some others in the show, of steel, this metal being now very favourably looked upon by makers for the purpose. It is butt-jointed in the longitudinal seams, and we are informed has been tested by hydraulic pressure to 240 lbs. to the square inch. The other necessary parts are all of the most approved construction, and, taken in its entirety, this engine and boiler may be said to be unique and to possess considerable merit. An eight-horse horizontal engine, Class B in the firm's list, on a cast-iron base, was a compact, good-looking piece of machinery; and a six-horse traction engine was noteworthy for several improvements introduced into it. There was also another compound engine of eight-horse (nominal) power. In this machine the boiler surmounted the engine, the whole being fixed on a strong wrought-iron girder foundation.

Messrs. RANSOME, SIMS & JEFFERIES (Limited), of Ipswich, vied with their competitors in their exhibits of this class of machinery, and it is only fair to state of this extensive and renowned firm that they did not lose by comparison. The most powerful engine displayed was a 12 horse-power, semi-fixed, with reversing gear, &c. It was especially adapted for purposes where economy in space has to be considered, and appeared a very suitable one for a contractor, sawmill, &c. Two portable engines of six and eight horse-power were noteworthy features, and we were much pleased with a three-horse (nominal) vertical, having a cross-tube boiler, designed for purposes where a small amount of power, and at intervals, is only required. In many building operations, or in a small contractor's yard, this engine would be found of great use, and it can be very economically worked, and its price is very moderate. There are other appliances in the collection of this firm adapted to the requirements of the builder, and an inquiry for their contractors' list will be courteously attended to.

Another firm located at Ipswich who have secured popularity for their engines is Messrs. E. R. & F. TURNER, of St. Peter's Ironworks. Although the firm do not enter so extensively into the manufacture of engines as some of their competitors, the articles that leave their workshops are good and reliable machines, and moderate in price. They were among the earliest makers of portable engines, having exhibited one at the Royal Agricultural Company's show at Norwich in 1849. They contain all the latest improvements generally found in such appliances, are well proportioned, and it is claimed that a higher average of efficiency is obtained in use. The Turner-Hartnell patent automatic governors, an invention of the firm, possessing some noteworthy advantages, are applied to their engines. The same remarks apply to their vertical engines and boilers adapted for contractors' and builders' purposes.

Mr. JAMES COULTAS, Spittlegate, Grantham, exhibited a portable engine and boiler, with a notable improvement for raising or lowering the chimney, which consists of a connecting-rod fixed to the top and extended to the lower part, where it is attached to a chain worked by an ordinary winch, and by actuating this the chimney is lowered to the required standard with ease. As compared with the mode hitherto adopted in engines of the portable type, which necessitated the attendant mounting it to effect the lowering of the funnel, this improvement will commend itself to all users of such machines, and it is somewhat remarkable that so clumsy and dangerous a plan as the old one has not been "improved away" long ere the present time.

The old-established firm of HORNSBY & SONS (Limited), whose extensive works are seen by the traveller on the Great Northern Railway as he passes by Grantham Station, as usual made an extensive display of most of their specialities. In the manufacture of traction and portable engines of different types this firm hold an advanced position, and at this show they exhibited a new portable engine that is worthy especial remark. It took the form of a compound portable of eight-horse power, resembling to some extent their inside cylinder-engines. The immersion of both high and low-pressure cylinders and the connecting passage in the steam-chest insures their being surrounded by the driest, and consequently the hottest steam, which forms the most perfect method of steam-jacketing, rendering the accumulation or even the appearance of condensed water in either cylinder almost impossible. This engine had also the automatic expansion gear, with eccentric controlling gear patented by the firm, and the most perfect minor appliances used by them, to render it as perfect a piece of mechanism as skill could devise. A six-horse traction engine of unique construction was also a commendable machine, and there were others shown possessing points of interest to the user, including a three-horse power vertical, adapted for electric-

lighting purposes, steady running being an essential point taken into consideration by the makers.

Messrs. CLAYTON & SHUTTLEWORTH, Lincoln, showed some first-rate steam-engines, patent lifting-clocks, lever and screw-jacks, &c. Among the former an 8 horse-power portable steam-engine is specially noteworthy. It possesses, in common with all the engines turned out by this firm, good boiler-room, increased cylinder area, fire-box of a capacity suitable for burning wood, coal, or other fuel, simple reversing eccentric, and one or two other recently-devised improvements to insure the utmost economy and durability.

Messrs. AVELING & PORTER, Rochester, exhibited chiefly traction and agricultural engines, but a salient feature of this firm are their patent steam rollers. The latter, which one now sees almost daily in one part or other of the metropolis, and which have come to be looked upon as indispensable for keeping in condition macadam or gravel roadways, are in constant demand. No contractor of any standing considers his yard complete without one of them, and the general adoption of these machines only affords another instance of the favour with which the substitution of steam for horse-power is regarded wherever practicable.

Messrs. NICHOLSON & SON, Newark-on-Trent, are another firm who manufacture a variety of portable and other steam-engines for industrial and general purposes as well as for agricultural use. They exhibited in the galleries a  $2\frac{1}{2}$  horse-power portable steam-engine known as the "Universal." It is a well-finished and compact specimen, and possesses many important points. The cylinder and slide-bars are cast in one piece and bolted to the crank brackets, the whole forming a continuous framework, and independent of the boiler, so that, if necessary, it may at any time be detached with facility from it for repairs or any other purpose. At the crank-shaft end the engine is bolted to a saddle-bracket, which is a permanent part of the boiler, and at the cylinder end it is carried on a V-shaped foot resting in a slide. By this it will be understood that expansion and contraction of the boiler will not affect the engine, so that the usual expansion stays are dispensed with, an item that considerably simplifies the working parts, and at the same time lessens the cost. Lastly, the boiler and many other portions are of steel, so that the maximum of strength with a minimum of weight is secured. A useful combined vertical engine and boiler, suitable for general purposes, was also shown here, the value of which is much enhanced by the hydraulic-flanged crown plate of the boiler; plate-flanging being a department in which the firm have of late much distinguished themselves.

Messrs. JOHN FOWLER & Co., Leeds, sent some admirable specimens of steam-engines, comprising a horizontal high-pressure engine with 10-inch cylinder, a compound semi-fixed "Yorkshire" engine, 10 horse-power (nominal), and a compound road locomotive mounted on springs, and also models of portable railways. The firm have for some time past been giving special attention to the compound principle in the construction of their engines, with the result that they now apply it to each one they build. Builders, contractors, and others will in future, when thinking of purchasing, do well to bear the following facts with regard to compound engines in mind. By the use of a low-pressure cylinder working in conjunction with a high-pressure cylinder, the greatest possible amount of expansion is obtained, and almost all the power in the steam is used before the residue is discharged into the atmosphere, the pressure of the exhaust steam being just sufficient to create a draught necessary for the combustion of the fuel. These engines will do the same amount of work with considerably less fuel and water than the ordinary single or double cylinder engines—in fact, there is a saving of something like 25 per cent. The working parts connected to each cylinder are equivalent in size, and the engine may be set going as readily as an ordinary double-cylinder engine by means of a valve-opening communication between the steam chests of the two cylinders, and so admits high-pressure steam direct to both. The cylinders are so proportioned that the work done is equally divided between them; and so much wear and tear occasioned by the shocks to which high-pressure single cylinder engines are liable is obviated. The waste steam from these compound engines also passes into the atmosphere at an unusually low pressure that there is little or no noise, and all danger from sparks prevented. Messrs. Fowler & Co.'s "Yorkshire" engine, as introduced by them some years ago, was, as we mentioned above, also shown, and it appears to have earned a reputation for economical working that will not soon be forgotten.

The EAST YORKSHIRE CART AND WAGGON COMPANY (Limited) occupied their usual position in the galleries with a good selection of carts, &c. This firm have a wide reputation as cart and van builders, and are useful manufacturers to contractors, corporate bodies, &c.

The BRISTOL WAGGON WORKS COMPANY (Limited) were also well represented, and their manufactures are well and extensively known both at home and in the colonies. One of their notable features as applied to carts is an improved tipping arrangement, worked by means of a powerful screw, which enables the cart to be raised to any angle, and retaining it in the position selected for tipping in heaps. As the back of the cart is not allowed to touch

the ground, a great saving in wear is effected by the prevention of the usual bumping or dragging along the road.

Messrs. R. & J. REEVES & SON, Westbury, Wilts, had amongst their exhibits a useful collection of water-carts, a department of their manufactures to which they devote much attention. An improvement was shown in their iron water-barrel carts, now made with wrought-iron wheels, the spokes of which are of strong half-round iron, rivetted in pairs. Most of these carts showed great strength combined with lightness and a minimum of friction or resisting power. They are useful alike for private use and for rural authorities, towns' use, &c.

Messrs. PFEIL & Co., St. John Street, E.C., had an attractive and useful display of engineering and other tools, and appliances designed for economising labour. A collection of chains and pulleys was also shown, and the firm may be recommended as a very useful one to the building trade as well as to the engineer. Some fine specimens of manganese steel attracted much attention. The fine texture and the ease of manipulation in the different purposes to which it was shown to be applicable were sufficient to satisfy those who examined it that it was calculated to play an important part in the future for many uses to which steel is applied.

An interesting exhibit was that of Messrs. F. ORME & Co., St. Andrew Street, Holborn Viaduct, comprising a variety of labour-saving machinery suited to the requirements of the engineer, carpenter, builder, blacksmith, cart and van builder, &c. Many of the machines are of American manufacture, the firm being importers of the best known appliances of the United States; in fact, it is not saying too much when we assert that most new appliances invented by our transatlantic friends suitable to the trades we have mentioned, soon find their way into Messrs. Orme & Co.'s stores. A variety of pumps were suitable for the contractor and domestic use generally. Notable amongst these was a hand rotary force pump of American invention and manufacture that we have selected for illustration. It is a most compact and powerful

apparatus for its size, is capable of lifting water from a depth of 25 feet, and forcing it to a considerable distance, and it is almost unnecessary to add will be found most useful under a variety of circumstances.

Another useful appliance in which the readers of this journal are generally interested, exhibited at this exhibition, was Brenton's patent safety bolts, shown by Mr. HENRY DENTON, the maker, of St. Peter's Works, Wolverhampton. They are adaptable for every purpose to which a bolt can be applied, from a small door to a railway truck. For the latter use they are made on the "cam" principle, while security is provided by means of a padlock. The security of the house bolt is effected by an easy and simple contrivance, and the approval it has received at the hands of jurors at various exhibitions, including the Royal Agricultural Society of England, and Continental and Colonial displays, clearly shows the interest with which it has been received wherever shown.

Messrs. J. & H. McLAREN, Leeds, are amongst the firms who appeared with machines that have undergone marked improvements. Their attention has been devoted principally to traction engines, with patent spring wheels, one of which was showed, and called forth considerable approbation. The alterations that have been made give the wheels a very increased degree of flexibility, combined with a general accession of strength. As now modified, each spoke is made up of three portions instead of being composed of one bar, as generally seen; and, instead of directly bolting the

spokes to the nave and outer rim of the wheel, each end of the spoke is turned up and held in its place by a steel clip, which being of what one may term a segmental shape, secures it with the utmost strength.

Messrs. DAVEY, PAXMAN & CO., Colchester, sent a collection of engines of such variety that all users of steam-power may have inspected them to advantage as much as the agriculturist, for whose especial benefit they were ostensibly on view. Portable, horizontal, and vertical were shown, and among the former class there was one specimen that possessed some unique points, its particular construction claiming to give increased facilities and efficiency in the working parts of the cylinder and slide-valve arrangements. The cylinder, slide-jacket, steam-jacket, and pockets for throttle-valve, safety-valve, and starting-valve are cast in one piece, with loose covers to each, so that all the parts are easily accessible. The crank-shaft, connecting-rods, and many minor fittings are of steel, thereby securing the maximum strength and durability without undue heaviness.

Among the engines sent by the READING IRONWORKS CO. (Limited), adapted for purposes other than agricultural, was one that they claim to be especially suited for driving dynamo machines. It is of the portable type, and has taken prizes on various occasions. The firm make and showed a specimen of a very convenient vertical engine and boiler, which they term the "Reading," and which they supply from 6 to 16 horse-power.

Messrs. R. GARRETT & SONS, Saxmundham, also sent a variety of compound and simple engines of various power, and applicable for most purposes. They had a novelty in the shape of a new patent spark-arrester, as attached to portable engines in which straw or wood may happen to be consumed. The arrester is placed close to the hinge of the funnel instead of at the top, where it is usually found; and this admits of the fireman lifting the funnel by a long lever or chimney-raiser, weighted to balance the funnel and sweep over the bed-plate into the smoke-box all the accumulation of soot and sparks. A new combined wood and iron wheel, shown for the first time, possessed advantages worthy of note.

Messrs. C. BURRELL & SONS (Limited), Thetford, showed traction and portable engines, with recently added improvements; and Messrs. SPENCER, CARTER & CO., Hitchin, W. TASKER & SONS, Andover, and Mr. W. P. ALLCHIN, Northampton, were present with kindred machines, all having points respectively peculiar to each, and well worth the inspection of intending purchasers.

## MR. MILLAIS ON MODERN PAINTING.

A CORRESPONDENT of the *Daily News* records a conversation with Mr. Millais relative to art. The first topic was the education of the artist. "It is very difficult," said Mr. Millais, "to understand where the mind of the painter comes in. His work has to be painted, and the highest intelligence is useless unless the man can produce with his fingers what his eye sees, and which, with certain mental distillation, should be at the end of his brush. What is the precise nature of this distillation it is not easy to say, nor can I understand how men whom you would call almost dumb are sometimes wonderful painters. Fred Walker, for instance, was rather a listener than a talker, and never had much to say upon any subject, yet the tender grace and delicate sentiment of his work were matchless, and actually astonished the French in 1878, who had never seen anything like his water-colours. Drawing and painting have their grammar, which can be taught and acquired to a certain extent like the grammar of speech or of music; but beyond this there is little to be done for a painter—everything by him. If I had a dozen young men painting in this studio of mine, the chances are that they would imitate my faults, as a certain French set do those of their master, who himself imitates nobody. You would have a quantity of young men painting alike, and turning out work of the Millais pattern of a kind of average quality. Who are the men who exercise influence? The very ones who have worked almost alone."

Mr. Millais next referred to the quantity of examples which are available for the student in English galleries and museums, and in foreign cities which can be reached without much expense. He added:—Raphael and Michael Angelo had comparatively little to study from but nature and a few antiques, trifling in number compared with those open to the modern student. All that previous work can teach him he can learn if he pleases, and at the Royal Academy we teach him the practical work of drawing and painting. So far as my own experience of a dozen years goes, it is of little use telling a student how to paint. The teacher must take the brush in his hand and show him how it is done. Painting is up to a certain point, and always in its execution, so purely technical a thing that it must be learned like sewing or sawing, filing or turning, from actual instruction and by great attention and practice. This manual dexterity, like the art of drawing, can thus far be acquired, like some knowledge of colour, composition, perspective, and so forth; but only up to a certain level, beyond which painting worthy of the name is too subtle a thing to be passed from hand to hand or from mind to mind. I have read

most of the best books on art, and I do not see it explained. I just quoted Walker, whose poetry seemed to be in his fingers only, and who, apparently, did exquisite work, as the violet has a sweet scent—naturally. Some students acquire manual skill far more rapidly than others, but nearly all may become so far proficient in time as to copy and sometimes fairly to imitate. But I need not tell you that painting of a high class begins where all this leaves off. It is when the student has assimilated the knowledge of others, and acquired the power of using his brush freely, that he has a chance of throwing all this aside and becoming a genuine painter. The strength to make this bound over the limits of teaching is not given to all, but it is this which defines the painter's work as original. Probably very few good painters could exactly define the moment of their emancipation, which is often slower than their canvases would indicate. This process, however, comes later, and has little to do with the actual technical teaching we are now giving our students at the Royal Academy.

The class of works now patronised was afterwards introduced. We are living in an age of transition, said Mr. Millais. The old order of things is giving way to what is newer, if not better. There seems to be a demand for truth—for actuality. The reason that historical and large *genre* pictures are now less painted than formerly is, as it seems to me, that there is much less heart in the work. Probably the painter does not believe in it, nor the public either, so much as they once did. Would any body now buy, much less paint, any of those friends of our childhood—*Alfred in the Neatherd's Hut*, *Canute and his Courtiers*, or *The Finding of the Body of Harold*? The painter might laugh at his own work. There is still an interest in works of a devotional character; but the passionate, intensely realistic, and Dante-like faith and worship which inspired the Old Masters is extinct, or nearly so. It is the difficulty of giving agreeable reality to sacred subjects which daunts the modern artist, living in a critical age and sensitive to criticism. I should like very much to paint a large devotional picture having for its subject *Suffer Little Children to Come unto Me*. I should feel the greatest delight in painting it; but the first question which occurs to me is, What children do we care about? Why, our own fair English children of course—not the brown, bead-eyed, simious-looking children of Syria. And with what sense of fitness could I paint the Saviour bare-headed under the sun of Palestine, surrounded by dusky, gipsy-like children, or, on the other hand, translate the whole scene to England? The public is too critical to bear this kind of thing now, and I should be weighed down by the sense of unreality in treating a divinely beautiful subject. The world is much older than it was thirty or forty years ago. It not only knows more in reality, but is more knowing in its attitude.

Mr. Millais also spoke on portraiture, and on the influence of costume, a subject which was lately treated by a writer in this journal (*The Architect*, November 29).

"It is," said Mr. Millais, "difficult to institute comparisons between painters, but the fathers of the brush may fairly be compared with the early poets both as to the sincerity of their work and the necessity for studying it in its proper light, and, so to speak, in its own language, with a glossary. There is much that is noble in them, much to admire and to honour, although their work is entirely different from that of Velasquez and Titian, Rembrandt and Vandyck. The portraits by these great artists are marvellous alike in realism, in dignity, and in superb technical execution. Portraiture until just of late has perhaps hardly been accorded its proper dignity in England. A good portrait is an historical picture in the most exact sense. It is not the portrait of a model in clothes which do not belong to him, but a picture of a more important person who forms a part of the history of his time, and it is always real for centuries on centuries. The brush-work of Titian and Velasquez, their superb technical skill and realistic but dignified transcript of their time, may endure for ever."

"I am much occupied in painting, and have hardly time to note and cite authorities, but my impression is that the costumes we think superbly picturesque were laughed at when they were worn. I know that the ruff we admire was the prime butt of contemporary satire, like the puffings and slashings of Henri II. and Henri III. In the latter reign there was a great outcry against the ruff, and there are pictures in which persons are represented with yellow ruffs. Again, the wigs of Louis XIV. and the Queen Anne period were considered absurd while they were worn, and were held up like other articles of dress to scorn and derision by Molière and others. The wigs of this period were very roughly treated by Hogarth, and the Directory and Empire costumes have only just of late grown old enough to be thought beautiful, while the more recent crinolines make some of Leech's drawings of pretty girls seem grotesque. A thing which is just old-fashioned without being old enough to have been refined by the touch of time is apparently always thought hideous, while the fashion of the present hour is generally laughed at. It is quite possible that the textures and colours we are now obliged to paint will not in the future seem either commonplace or hideous. There is infinite variety in modern shooting or riding-dress, and even black itself is not a bad colour for a portrait. It seems to have been held in high favour by Velasquez, Vandyck, and Rembrandt. Rough

tweeds, velveteen, and corduroy look ordinary and perhaps mean to our eyes, but two hundred years hence they may possibly be admired, as we admire the costumes called after Henri II., Henri III., and Louis XIII."

In conclusion Mr. Millais said:—"I do not know any more encouraging sign of the condition of art in England than the general high quality of illustrations in newspapers and periodicals. The improvement in the general goodness of such work has been extraordinary. Nothing is easier than to find fault; but, to me, the progress made during the last few years has been most satisfactory. There is no need to despair of art in this country."

### JUDICIAL DEFINITION OF "SITE" AND "FOUNDATION."

AN important case was decided in the Queen's Bench Division on Saturday, after arguments which lasted during two days. The judgment will affect metropolitan and other works henceforth. The facts were as follows:—

On June 17 last two complaints had been made by Mr. Thomas Blashill, district surveyor of Bethnal Green, against Mr. George Chambers, a builder. One complaint charged the respondent with having on March 13 last unlawfully committed breaches of the by-law made by the Metropolitan Board of Works under the provisions of the Metropolitan Management and Building Acts Amendment Act, 1878, by commencing to build on a site and foundations at the south-west corner of the Peel Grove Burial Ground, which had been filled up with materials impregnated with human bodies—without the said animal matter having been first properly removed. The other complaint charged the respondent with breaches of the provisions of section 17 of the same Act (41 and 42 Vic. c. 32), in not having pulled down and removed a house built by him on the spot in question, and in having failed to comply with a notice given to him to that effect by the appellant. The piece of ground in question formed part of an old private unconsecrated cemetery which had been closed by an Order in Council in 1855, when, as it was estimated, from 18,000 to 20,000 persons had been buried in it, a large number of whom had died during the visitation of cholera in 1849. Some interments were made on the piece of ground built upon by the respondent, but by far the greatest number in other parts of the cemetery. After 1855 the surface of the cemetery had been raised by depositing thereon builders' rubbish to a depth varying from one to four feet. Early in 1883 the respondent had given notice to the appellant of his intention to build upon the south-west corner of the ground, and had commenced excavating the builders' rubbish for the purpose of laying the foundations of the buildings so intended to be erected by him. The appellant had thereupon given him notice that he should require him to remove any objectionable matter (as laid down in the by-laws of the Metropolitan Board of Works) which might be met with down to the bottom of his foundations, and that if he interfered with bodies in making such foundations, he (the appellant) should have to take proceedings, and presumed the parish would do so too. The by-law referred to by the appellant was made pursuant to section 16 of 41 and 42 Vic. c. 32. Section 14 of that Act is as follows:—"The term 'foundations' shall mean the space immediately beneath the footings of a wall. The term 'site' in relation to a house, building, or other erection shall mean the whole space to be occupied by such house, &c., between the level of the bottom of the foundations and the level of the base of the walls." The by-law in question is in these terms:—"No house, building, or other erection shall be erected upon any site or portion of a site which shall have been filled up or covered with any material impregnated by or mixed with any faecal, animal, or vegetable matter . . . unless or until such matter shall have been properly removed by excavation or otherwise from such site. . . . The site of every house or building shall be covered with a layer of good concrete at least six inches thick . . . unless the site thereof be gravel, sand, or natural virgin soil. The foundations of the wall of every house or building shall be formed of a bed of good concrete not less than nine inches thick, and projecting at least four inches on each side of the lowest course of footings of such walls." The respondent had, in fact, made a bed of good concrete 18 inches thick immediately beneath the footings of his walls, and had covered the whole space intended to be occupied by his buildings with a layer of good concrete 12 inches thick. No portion of the soil which had formed part of the cemetery had been moved or disturbed by him, as his foundation and layer of concrete were all above the lowest part of the builders' rubbish which had been deposited on the cemetery after 1855. It was, however, also proved before the magistrate that the natural decay of human bodies might lead to subsidence so as to cause fissures in the concrete, however thick, and to the emanation of noxious gases. It was contended before Mr. Hannay, on behalf of the appellant, that the meaning of "site" and "foundation" was the natural virgin soil of the earth, and that this soil having been taken away, and the cavity having been filled up with dead bodies, made the "site" and "foundation" lower down to the extent of the depth of the graves (many of which were 20 feet and even

25 feet deep) than it had been before. On behalf of the respondent it was contended that the meaning of "site" and "foundation" in the by-laws was that placed upon it by section 14 of the Act (41 and 42 Vic. c. 62), or that the by-law must be regarded as *ultra vires*. The magistrate decided this question in the respondent's favour, and that the foundation and site of the buildings erected by Mr. Chambers had been prepared in accordance with the by-laws. Mr. Hannay being further of opinion that the first part of the by-law was not applicable to the present case, as he considered human bodies buried in coffins not to be "materials impregnated with animal matter," dismissed both the summonses.

Sir Hardinge Giffard, Q.C., and Mr. Besley, instructed by Mr. Burton, appeared for the appellant; Mr. Gainsford Bruce and Mr. W. Graham were for the respondent.

Mr. Justice Grove, in his judgment, said he was of opinion that the magistrate, before whom the same argument had been used as before the Court, had rightly decided the case, and that the respondent was entitled to judgment. It was difficult to give a perfectly logical interpretation to the definition of "foundations" in the Act now in question, but the only reasonable construction, as he (his lordship) thought, was that it meant the actual portion of the ground to be covered and pressed upon by the lowest part of the walls of a building. As to the definition of the word "site" in the Act, it was equally difficult to give it a strictly logical construction, but, as he read it, it meant the place which the building filled up and on which the house was to be placed and not its *locale*. The words "foundations" and "site" in the by-law, unless obviously used in a different sense, must be construed in the same sense as that in which they had been used in the Act conferring the power to frame such by-law. The appellant asserted a right to have the whole of the soil removed as being impregnated with animal matter; and in his (his lordship's) opinion it was so impregnated. But the question was whether or not the case came within the terms of the by-law, and whether a rational construction of this by-law required a different meaning to be given to the word "site" in it to that which it had in the statute. In the latter case, as he thought, the by-law would be clearly *ultra vires*. In his (his lordship's) opinion the power claimed by the appellant was neither reasonable nor such as had been given him by the Act in question. With the first part of the decision of the magistrate he agreed, and holding, therefore, that the proper construction of the Act and of the by-law was as contended for by the respondent, he must hold opinion that the appeal must be dismissed.

Mr. Justice Hawkins, in concurring, said that on looking at the facts of the case as stated by the magistrate it was clear that the foundations made by the appellant were even better than the statute or the by-law required them to be.

Mr. Besley asked that the appeal might be dismissed without costs. The cemetery had been closed by Order of Council in 1855. The ground for the graves had been sold in perpetuity to the relatives of those interred there, and now the land had been dealt with by the freeholder in another way, as there was nobody now surviving to enforce the rights conferred forty years ago. The appellant was not contesting the case in his own interest, but really in that of his lessor.

Mr. Gainsford Bruce said that that was not really so, as the appellant had covenanted to erect the buildings on the land.

The Court refused to make any order as to costs, on the ground that there was nothing in the case to make it an exception to the rule that an appellant had to pay the costs of an appeal in which he was unsuccessful.

### LOCAL HISTORY AND ANTIQUITIES.

AN address was delivered by Mr. E. A. Freeman, Regius Professor of Modern History in the University of Oxford, at the *conversazione* of the Lancashire and Cheshire Antiquarian Society, which was held in the Manchester Town Hall on the 11th inst. Professor Boyd Dawkins, the President of the Society, took the chair, and in referring to Professor Freeman said they all knew that history and antiquarianism are most intimately connected, and that really the principal duty of the antiquarian pure and simple is to act, if he might use the phrase, as a sort of jackal to the historic lion who came along and devoured what the jackal pointed out, and put it into books fitted to delight the world.

Professor Freeman, in the course of his address, said it must be remembered that general history is to a great extent made up of local history. One did not know the history, say, of England, unless he knew the history of the several districts and towns of England—unless he knew their characters and what distinguished them from each other. Take, for instance, two cities at almost the two ends of England—take Carlisle and Exeter. Carlisle had several things peculiar to itself. It was a city which remained in ruins from the Danish invasion till the latter end of the eleventh century. It was then called into being by William Rufus, and remained from that date, as long as there was any quarrel between England and Scotland, the great border fortress of England against Scotland. Thus Carlisle had a marked and characteristic history which distinguished her from every other spot in the king-

dom. It had a history which formed a very important part of the history of England. Exeter in like manner had a history peculiar to itself. Amongst all the great cities of England Exeter was the one whose life was the most uninterrupted, which had gone on from the most early times till now without any break. In the case of Chester, Bath, and many other places, we know for certain that they lay desolate for longer or shorter times. We know for certain, or we might infer with great probability, that the like thing happened to some other cities. To Exeter we knew it never did happen; there was no break in the life of Exeter from the beginning. So they might go on to nearly all the chief towns of England, and find something in the history of each which distinguished it from all others. Assuredly, in those two shires which formed the working ground of that Society there was a great deal that was very curious and very distinctive, both in early and in later times. First of all, do not let them be angry with him—do not let them cry out at him for speaking treason against local prejudices—if he said that the first thing that seemed to him amazing was that there should be such a county as Lancashire at all. He knew nothing about it; it did not come into being till after his period of history. He knew Cheshire perfectly well and Yorkshire also, but he did not know about Lancashire. It was not mentioned in Domesday-book. He found that there was a county of Cheshire which occupied a very marked position in Domesday, indeed stood out as having a greater degree of separation and independence from the mass of the kingdom than any other part of England. They had the great Earldom of Chester, in which the Earl had powers that hardly any other subject in England possessed, and held almost the position of a king within his own earldom. Chester formed one great principality in that corner of England. There was another great principality held, not by a lay lord, but by a spiritual lord, further to the north—that was the Bishopric of Durham. Now, supposing all the earls and bishops had had the same powers as those, what would have come to pass? England would have been broken up in the same way as Germany and France were broken up, and instead of a united community there would have been a collection of principalities, perhaps separate from each other or perhaps united by some loose tie or other. But the policy of the Conqueror forbade the creation of anything like an independent power, except on the borders of the kingdom. The Earls of Chester, Shrewsbury, Hereford, and Northumberland, and the Bishop of Durham occupied a separate position, because they had to guard the frontiers of the kingdom, and were therefore favoured with exceptional privileges and exceptional powers. Of all those quasi-independent powers, the Earldom of Chester and the Bishopric of Durham were the two which stood out most distinctly. Then in the district in which they were met they had, as they found it in Domesday, a remarkable state of things. As he had said, there was no such county as Lancashire in Domesday. It was Cheshire up to the Ribble and Yorkshire beyond. That was his geography. But a certain part of Cheshire—the land between the Mersey and the Ribble—was marked out in a special way, although it had no name. If we studied the entries in Domesday with regard to this land, we saw a great deal that was very curious and instructive. The whole land, it appeared, had been in possession of one man, who was not called an earl but had something like the position of an earl—that was Roger, the son of the great Roger of Poitou. Every Lancashire and Cheshire antiquarian must know that the tenures of the land in Roger's land were very singular. We found certain persons spoken of as thanes, but they had nothing like the position of thanes in other parts of the country, and seemed to have had to render very burdensome and mean services. In Cheshire and the land between the Mersey and the Ribble there was material enough to employ a good number of workers for many years in working out the minute details. At Hull, the other day, he pointed out that there was one remarkable difference between France and England. In France the oldest towns in the country, those which were first founded and those which were the greatest in earlier times, had remained, with very few exceptions, the chief towns to this day. As a general rule, it would be found throughout France that the chief towns were the old capitals of the Gallish tribes. The only town in France which had risen from a very small condition in recent times and had become one of the chief towns of the land was St. Etienne. But here in England the rule was exactly the contrary. The oldest and most famous cities in England were no longer the greatest. If we wanted striking proof of that we need not go further than the clauses of the Redistribution Bill. Liverpool was, according to that Bill, nine times as great as Exeter. That, he confessed, almost took his breath away. He supposed it was all right; he supposed we must arrange things according to the facts, yet somehow he did not exactly like it. Some among them might think that Exeter should have kept its two representatives and Liverpool have gone on with one or two less than nine. If a Redistribution Bill of that kind were introduced in France, Lyons and Marseilles would still be left at the top of all the towns except Paris, as they had been as far as the history of the country went back. In that district was one of the great and famous cities of England. He had not got the whole of the Redistribution Bill off by heart, and was not sure whether Cheshire would keep even a member or two. But there was Deva, the City of the Legions,

which still retained large portions of its Roman walls and its mediæval walls nearly perfect; there was also that Chester which was the last city in England to submit to the Norman conqueror, and which had played a great part in this country ever since. He had no reason to believe that Chester had gone back or places had gone on faster. When we came to its new rivals, above all to Manchester, there was a great deal that was very instructive in history. After all, such towns were not new places. There were very few places in England which had absolutely sprung out of the ground, like so many of the great towns in America had. All the places to which he referred had a history. In proof of that he would take three great towns in England—Manchester, Liverpool, and Birmingham—the importance of all of which was modern; the places themselves, however, were not of modern birth. They existed from the beginning as small places; in later days they had come to be great, and had outstripped other places. All those places, therefore, were not modern in their origin, though they were in their history. If any one who had the local knowledge would go through the earlier history of the other places which had grown to importance in later times, it would be found that they, too, had peculiarities and distinctions which might be worked out in the same way. Wherever we went we could learn some lesson on the spot which could be applied either directly or by way of analogy to the study of the history of our own country, and then we could turn the history of our own country to account in considering the general history of Europe and of the world. In studying that general history it would be noticed that after all the towns and cities of England, old and new, did not rival in many respects the great cities in some lands on the Continent. That was because the cities and principalities on the Continent broke away from the general power and set up for themselves. Each place standing thus by itself had had a great history, and had erected magnificent buildings surpassing anything we had in this land. On the other hand, that history and prominence were purchased by separation, dissension, and wars between different places. In England, however, the separate parts had never had the same independence nor the same importance. For that reason even our ancient cities had not so much to show as many less cities had on the Continent. Our history was the history of a united people, and what prominence was taken away from particular places had added to the general importance of the whole. A local antiquarian society like the one he was then addressing should work out things from that point of view. They should work out the history of every district, and not simply the history of towns, but the history of the smallest villages, for they must remember that such local history was part of the history of England, and that the history of England itself was only part of a greater whole, the history of Europe.

#### A JOHNSON MEMORIAL.

A TABLET was placed in 1865 on the house in Old Square, Birmingham, which was in the last century occupied by Mr. Edward Hector, a surgeon. It recorded that Dr. Johnson was a guest in his friend's house. When the house was pulled down in connection with the operations of the Birmingham Improvement scheme, the wainscoting, the door, and the mantelpiece of one of the principal rooms were preserved by the Improvement Committee of the Corporation with a view to their ultimate use as a memorial of Dr. Johnson. This object has now been achieved through the zeal of the members of "Our Shakespeare Club" and the Archæological Section of the Birmingham and Midland Institute. These gentlemen, with the ready consent of the Improvement Committee and the Baths and Parks Committee, have had the relics used in the decoration of a room at Aston Hall, hereafter to be known as "Dr. Johnson's Room." The panelling is supposed to have been constructed in one of the years between 1814 and 1820. It is of English larch, the place of which is taken in modern times by deal, and is well raised and deeply moulded. When it came into the hands of the donors of the memorial it was grained oak, but Mr. J. A. Cossins, architect, who, as a member of the Archæological Section, has superintended the work, discovered that the original colouring was a dead pale blue, something like the modern peacock-blue. This colour has been accurately matched, and the walls of the room, which are covered from floor to ceiling by the wainscoting, now present almost precisely the same appearance as those of the room in which Hector and Johnson, and his friends, no doubt had many learned friendly chats. The room selected is No. 17, formerly one of the Chinese rooms, and the old-fashioned mullions of the window (which looks out on the statuary pavilion) harmonise tolerably well with the present covering of the walls. It is intended that the apartment shall contain such memorials of Dr. Johnson as may be given or lent to the Corporation. At present the room is almost bare. The tablet already referred to has been placed in the room.

M. Clermont-Ganneau is about to publish a volume on the Shapira and other frauds, which he discovered in connection with the archæology of Palestine.

## NOTES AND COMMENTS.

ALTHOUGH there is a defect of nineteen millions of francs in the Belgian budget, the authorities of Brussels are taking steps to uphold the building trade in the present crisis, having a conviction that eventually it will be the more economical policy. Several works on a large scale are to be undertaken in the city. A boulevard is to be opened out from the Etterbeck Barracks to the Avenue Louise. Quarters for firemen are to be constructed near the Place de la Liberté. The buildings of the old Palais de Justice are to be transformed into part of a communal museum, and from the position no better arrangement could be adopted, as the new museum will be near the Palais des Arts et de l'Industrie. A theatre is to be built on the site of the Entrepôt near the Canal Basins in the north-east; an Eden theatre, on an immense scale, has been commenced near the Bourse. Not far from it will be the new Bureau des Postes. Several commissions for statues for public places are also to be given to sculptors. The outlay for all these works will be enormous, and it is not surprising that in Paris there are people who are envious of the financial resources of the Belgians.

THE death of M. JULES BASTIEN LEPAGE removes a man who was likely to have exercised a great influence on French art. The son of peasants, his sympathies were with the toil-worn country people, and, without being in any way an imitator, he followed MILLET and COURBET, COROT and DAUBIGNY. He was one of those men in whom opposite qualities are found. It was difficult to say whether he was more a realist than a mystic, and works which were akin to those of the Impressionist school were finished with extreme elaboration. There is a striking rebuke to French luxury when a half-starved peasant is represented on canvas without any shirking of details, and it is not surprising that M. BASTIEN LEPAGE's patrons were often found outside France. An English painter who selected consumptive factory "hands" for subjects could not, for the same reason, expect to find purchasers among wealthy connoisseurs in this country. It was somehow characteristic of the age that, in the contest for the Prix de Rome, BASTIEN LEPAGE should be overcome by M. LÉON COMERRE, who paints those wonderful ballet-girls which in an exhibition are always surrounded by a crowd. A young man who introduced angels of a Mediæval type along with peasants that were more typical of French plainness than of academic beauty could hardly expect success, and it is creditable to the jury that he was awarded even a second medal. But his course was taken. His art was typified by the picture of *Joan of Arc*, where a genuine peasant girl, without any of the prettiness that is seen in the popular statuette by the Orleans princess, sees visions, and resolves to act upon the inspiration they give. He tried to be truthful without going out of his way in search of ugliness. There is lovely colour to be found in his canvases, as in the trees and vegetation in *Le Père Jacques*, and his portraits are among the best of modern works. Those of his father, of his brother (M. BASTIEN, the architect), of SARAH BERNHARDT (in profile), of ALBERT WOLF, are admirable. The general regret for his death is intensified when it is remembered that for two years or more he was aware that there was no hope for him in surgery.

A CASE which is of deep importance to surveyors was heard on Wednesday before Mr. Justice WILLS. In 1882, Mr. FARMER, of the firm of Messrs. DEBENHAM, TEWSON, FARMER & BRIDGWATER, was requested to value a wharf, at Blackfriars, belonging to King's College, Cambridge, which was required for widening the London, Chatham and Dover Railway. The valuation was 22,000*l.*, being thirty-three and a half years' purchase of the ground rent, with 200*l.* for compulsory purchase. The arbitrator awarded 20,000*l.* Mr. FARMER's account amounted to 121*l.* 16*s.*, being 118*l.* 13*s.* for inspection and report, and 3*l.* 3*s.* for attending as a witness. The larger fee was based on RYDE's scale. The college authorities paid 24*l.* 3*s.* into Court, being 20 guineas for the inspection. It was pleaded that there was no evidence to bind the defendants to pay according to RYDE's scale. Mr. Justice WILLS in summing up said that he should not leave the question of the alleged custom to the jury, as there was no evidence of any such usage or custom as would bind the outside public in their dealings with surveyors. The jury found

for the plaintiffs, but stated that the amount claimed was excessive, while there was no evidence to enable them to decide what was a reasonable remuneration.

M. CHARLES BRIAS, a well-known Belgian painter, died lately, at Brussels, in his eighty-seventh year. He obtained the first prize for genre painting in 1824. M. BRIAS took an active part in the Belgian Revolution of 1830. He was said to have been the first to enter the Park at the head of a band of insurgents, and in the attack he was wounded. All his fortune has been left to the hospitals of Brussels and Malines.

THE Chelsea Vestry intend to enlarge the vestry hall in the King's Road. The additions will comprise a vestry hall, with an area of from 3,000 to 3,500 square feet, a secondary hall with an area of 1,500 feet, a committee-room, kitchen and offices, reception and retiring-rooms, &c. The proposed outlay, exclusive of furniture and fees, is 15,000*l.* The first prize will be 100 guineas, the second 50 guineas, and the third 30 guineas. Should the author of either of the three designs be selected as architect the premiums will not be given. A professional assessor will be appointed to advise generally as to the designs after they are delivered. If, in the opinion of the assessor, a design cannot be carried out within 10 per cent. of the amount named, the competitor will be disqualified from receiving any premium. The drawings are to be on the scale of 8 feet to an inch. No perspective whatever will be admissible. The designs are to be lodged on or before February 23, 1885.

BELGIUM has supplied so few examples of the Bronze Age that archæologists have been puzzled. Great importance is therefore attached to the discoveries which have been made at Sinzin by members of the Archæological Society of Namur. In an ancient grotto several objects, such as buckles, pins, and knives were exhumed, which correspond in form and character with the figures in M. DESOER's book on the Bronze Age in Switzerland, and are therefore supposed to be of unquestionable character. It is remarkable that although a great quantity of bones of men, women, and children were found in the grotto, it is impossible from them to complete a single skeleton. A part of the frame is always absent. The conclusion has been drawn by some of the archæologists of Namur that the grotto at Sinzin was probably a place where offerings were deposited, rather than a cemetery. It is also supposed that the forest was the scene of Druidic or other rites, in which human victims were immolated. But until the report which is in preparation appears in the transactions of the Namur society, it is impossible to assess the value of the discoveries.

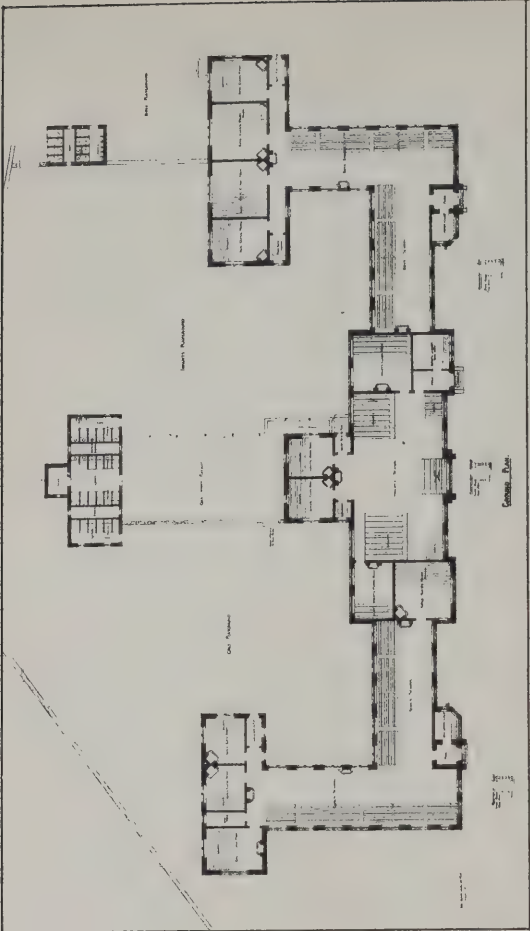

THE unfortunate dispute between the Bishop of PETERBOROUGH and the Dean has not suspended the efforts of the Restoration Committee. On Wednesday the following resolution was adopted:—"That the Restoration Committee is of opinion it is desirable that the Dean and Chapter adopt the first stage of Mr. PEARSON's modified plan for rebuilding and raising the central tower, and that the work be at once proceeded with, the committee recommending that a special fund be raised to defray the additional expenditure involved by this deviation from the original plan."

THE general depression seems to have had its influence on the production of Christmas cards, for this season the designs are less elaborate and expensive than those of former years. Considering the prices at which the cards are sold, it is surprising to find such good work. Messrs. RAPHAEL TUCK & SONS have, as usual, many delightful designs. Some which are quaint and humorous are specially designed for art patrons who are still in the nursery. Other cards are made attractive by music as well as drawing, and the entire collection shows skilful superintendence. Messrs. MEISSNER & BUCH, of Leipzig, depend mainly on floral designs, which are generally rich in colour. Messrs. HILDESHEIMER & FAULKNER have in the "Dream of Patience" produced the best card of the year. The dainty selection from BURNS is deserving of success. Mr. NOEL PATON's landscapes, with poetry by Mrs. CRAIK, are also tasteful cards. It is evident that the firm expends a large sum in securing designs,

## ILLUSTRATIONS.

"SANDILLS," REIGATE HEATH.

THE house shown in the accompanying sketch perspective view has been recently built from designs by Messrs. CLAYTON & BLACK, of Brighton. It possesses one feature of interest as one of the few country-houses entirely lighted by electricity (so far as artificial light is concerned), the supply being generated during the day time, and stored in accumulators for use at night. The stables, &c., are lighted in the same way, the whole of the machinery being easily managed by ordinary servants under the direction of the owner, who himself arranged the details of the lighting system. Although the house is within reach of the gas service of a local company, it appears that the cost of the electric light is very little in excess of the price of gas, while the advantages of cleanliness, clearness, and purity are obtained.

THE BRADFORD CAFE.

THIS is the principal branch establishment, in Bradford, of the Bradford Coffee Tavern Company, and was opened in the early part of the year by Mr. ALDERMAN F. PRIESTMAN, the chairman of the company, as a high-class restaurant. It is situated in the principal thoroughfare—Market Street, at the corner where Booth Street intersects it.

The building was formerly occupied as a draper's shop with offices over, and has been completely gutted and transformed under the direction and from the designs of Messrs. MILNES & FRANCE, architects. The basement has been converted into a spacious and well-lighted grill-room, with service-room adjoining, and connected with the kitchen (which is on the top floor) by a lift. The ground-floor contains the dining-room illustrated to-day. Admission to this room is by a porch of American walnut, with swing doors, the panels of which are filled in with leaded quarries. The dimensions of the dining-room are 40 feet by nearly 30 feet. The dining-tables are arranged on two sides and in the centre, the seats being of the "settee" form, upholstered in frise velvet, and the whole of the woodwork is of American walnut. The walls up to the surbase moulding (which is of a good height) are panelled in the same wood, and above are covered with "Tynecastle tapestry" in two shades of yellow. The ceiling and beams are decorated in distemper. At the east end is the service-room, separated from the dining-room by the screen and counter shown in our illustration. The screen is glazed with coloured-leaded quarries, and in the centre has a "side-board" recess fitted with shelves and small doors communicating with the room behind. The counter is semi-elliptical in plan, and is of St. Ann's marble as to the top, and of American walnut as to the remainder.

The gas fittings were all made from the architects' designs by Messrs. FREEMAN & COLLIER, of Manchester. The fittings, upholstery, and decorations were carried out by Messrs. C. PRATT & SONS, of Bradford.

The upper floors of the building are filled up in an equally artistic style, the first floor being the smoking-room, and the second the billiard-room. Lavatory and water-closet accommodation is provided in each of these two floors. The alterations have involved an outlay of about 4,000*l*.

NEW MARKET HALL AND PUBLIC OFFICES, EBBW VALE.

THESE buildings have been erected by a limited liability company of local shareholders, at a cost of about 3,100*l*. The front portion consists of four lock-up shops, with a private room attached to each. Over these shops are the Local Board offices and large Board-room, with private side entrance. In the rear is a public market hall, 100 feet by 62 feet, arranged with small lock-up shops round the walls, fitted with galleries over, for the accommodation of part of an audience on the occasion of public meetings, &c., for which purpose it is also intended to use the market. The outer walls are of blue Pennant local stone, relieved with buff brick quoins, &c.

NEW HOTEL, EBBW VALE.

THE site is opposite the market buildings, with two extensive frontages of similar treatment. The work has been carried out by Mr. T. FOSTER, of Abergavenny, at a cost of about 2,900*l*., and the building will be opened at Christmas. Mr. E. A. JOHNSON, of Abergavenny, is the architect for both buildings.

BOARD SCHOOLS, YEADON.

THE building shown in the illustration has been lately erected from the designs of Mr. W. J. MORLEY (now of the firm of Messrs. MORLEY & WOODHOUSE, of Bradford and Bolton). Accommodation is provided for 1,070 children, the schools being divided into three departments. Those for the boys and girls are placed at either end, while provision is made for the infants in the centre. The department for boys consists of two large rooms, 53 feet and 75 feet long respectively, with a width of 20 feet in each, the height of the lock-couple ceiling being also 20 feet. That portion of the building devoted to the girls is similarly arranged, and each school has four large class-rooms opening out of the larger apartments. The infants' school consists of a room 60 feet by 32 feet by 22 feet high, and is provided with a similar number of class-rooms to the other departments. Separate entrances have been provided for each department, and in addition doorways have been fitted up at the back which give access to the playgrounds, of which there is one for each department. Covered grounds have been laid out for the girls' and infants, the latter having a covered approach leading to theirs from the school. The total cost is about 5,000*l*., including lighting and heating, and the expensive boundary walls. The interior wood is composed of varnished pitch pine.

The contractors for the work were Messrs HARGREAVES, masons, Rawdon; Messrs. TAYLOR, joiners, Yeadon; Mr. LUMB, plumber, Yeadon; Mr. EDWARDS, painter, Rawdon; Messrs. WHEATER, plasterers, Calverley; and Mr. STONER, slater, Bradford; Messrs. GREEN & Co., of Leeds, supplied the heating apparatus. Mr. KENYON was clerk of works.

CHURCH, WORPLE ROAD, WIMBLEDON.

THIS church was lately designed by Mr. W. D. CHURCH, architect, 12 South Place, Finsbury.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fourth ordinary meeting of the Institute of Architects took place on Monday evening, Mr. David Brandon, vice-president, in the chair.

The CHAIRMAN explained that the president, Mr. Ewan Christian, had accepted a friendly invitation to be present at a meeting that evening in Leeds, of the Leeds and Yorkshire Architectural Association, and had requested him to make that the apology for his absence.

## Semper's Theory of Evolution in Architectural Ornament.

Mr. LAWRENCE HARVEY read a paper on this subject, and prefaced it with a short notice of Professor Semper, who, he said, was considered in Germany to be one of the greatest architects that ever lived. He compared him with Wagner, the great musician, both Wagner and Semper being reformers in their respective arts. Semper was born at Hamburg, in 1803, and was the son of a wealthy manufacturer. His mother was a woman of Elizabethan type, possessed of great natural firmness and decision of character. All the works that Semper carried out, or only designed, were certainly works of the highest merit, but did not suffice to explain the unique position he held among his fellow-countrymen. Semper was convinced that the beginnings of art were to be found in the humble crafts which supplied the necessities of every-day life, and that even now that they exercised the greatest influence in forming our taste. He was one of the first to maintain the importance of founding museums of art work. He did not know what Semper had to do personally with founding the South Kensington Museum, but he was surprised to find that Semper's dream was first realised in England. Was it too much to believe that in private intercourse with eminent men who had started the art revival in England, Semper had many an opportunity of imbuing them with his ideas? Or was it accidentally? At twenty-two years of age he joined the School of Architecture in Munich, and became acquainted with Gothic style. From 1826 to 1830 Semper remained in Paris. His master there was Goux, and to him Semper owed his artistic principles. Later on Goux wrote of Semper's work that his book was a warrant that Semper had understood his teaching, &c. Semper left Paris, and travelled for three years in Sicily, Italy, and Greece, and on his return published a work. Then, through influence, he was appointed Professor of Architecture at the Academy in Dresden. A great opening was here afforded him, and what he did with his opportunities might be seen by the buildings in Dresden. In 18 Semper assisted the revolutionary party, helped to build the barricades, and had to fly for his life. Why he joined had never been explained. Some said he found the men were building the

barricades altogether wrongly, and that he could not resist setting them right. The most likely explanation was that Semper had probably joined the revolution through pique, after being checked by the authorities in one of his pet plans. In 1851 Semper became professor in the School of Design, Marlborough House, which he ultimately left to become professor at Zurich. Finally, he died at Rome in 1879. Mr. Harvey then proceeded with his lecture on Semper's work, and drew attention to the drawings, partly derived from the work, and explained them. The heads treated of in the lecture were as follow, but time did not allow the author to develop more than a few of them:—Personal ornament or clothing the earliest artistic effort of man. Classification of the arts which precede architecture and lend it ornamental features. Textile products, their primitive use in architecture, their imitation in decoration. The Oriental and the Greek principles of colour decoration. Influence of the use of flax, cotton, wool, and silk upon art in general. Embroidery the origin of basso-relievos, statuary, and painting. Upholstery of the ancients, polychrome architecture, chromatic scales, connection between costume and architecture. Study of the different ways of clothing structures in New Zealand, China, India, Mesopotamia, Egypt, Greece, Rome. The influence of pottery, carpentry, joinery, and metal work in the formation of architecture. Under the head of "The Clothing Principle in Architecture," Mr. Harvey said:—

Greek art is not of native growth, but is a development and combination of the Assyrian and Egyptian arts. In both these older countries decoration consisted in clothing the structures, either by covering their surface or by incrustation; in Greece the clothing of a building is neither material as in Assyria, nor imitative as in Egypt, where the bearing pillar seems independent of the lotus stems bound round it as an ornament, but in Greece the clothing is reduced to an abstraction, viz., is the colour which covers the buildings outside and inside. This Greek refinement must be attributed the absence of apparent joints in the stone walls of the cella, by which the construction is disguised as by a thin veil, so that clothing and construction are one, whereas with the barbarians they were mechanically not organically united. Nevertheless with the Greeks, as with the Assyrians and Egyptians, the essence of the decoration is the masking of reality. All temporary festal structures are ornamented by clothing such as garlands of foliage, bunting, tapestry, flags, and these short-lived erections served as models for the permanent monuments which replaced them. Solomon's Temple was a copy of the Tabernacle, in which layers of skins were replaced by gilt facings of cedar. The stone theatres of Rome succeeded to the wooden ones, the triumphal arches to the rough scaffolding of poles covered with painted representations of the Roman victories and of the spoils of the vanquished. It is in these temporary decorations that we discover art in its very first beginnings. Art's main characteristics have endured in its later developments, and clothing is still now the essence of all arts, of poetry, sculpture, and painting.

To follow Semper's argument on these points would carry us too far, so we must pass on to the study of the transformations in the clothing principle brought about by the change of materials and technical improvements. For instance, the wooden idol was first covered with festal clothes; secondly, the clothes were replaced by metal beaten on to its surface; thirdly, the wooden kernel of the idol was left out, and metal coating alone remained. Such was the construction of the oldest colossal statues of antiquity shown by Pausanias in his description of the statue of Zeus Hypathos on the castle of Sparta. Fourthly, casting was introduced in its early stage as a thin coating of bronze laid on a kernel of iron. Then, fifthly, hollow casting was invented. Such are briefly the principal stages in the historical development of statuary; and as marble and terra-cotta statues were perhaps later developments of statuary, we shall find that the history of architecture runs very much on the same lines, although, on account of the variety of building materials, architecture is a vaster subject of inquiry.

In the Exhibition of 1851 there was a model of a New Zealand village, wherein Semper was struck to find an instance of the art of plaiting applied to the making of walls for the defence of villages and houses, a fact which strengthened his conviction in the textile origin of walls. The tops of the piles which supported the woven walls were decorated with carved heads, which probably took the place of the heads of their foes.

The importance of China for the study of the origins of art is great. Primitive architecture, exemplified in the ruins of Asia, Egypt, and Magna Græcia, may now be studied in Chinese architecture, which has remained unchanged from the most remote antiquity. Chinese construction is made up of parts not organically connected. Posts carry the roof and ceiling, the walls are apparently nothing but screens. The Polynesian plaited fence is here developed into a rich ornamental system, namely, the lattice-work which is always found in the Chinese house, &c.

The opinion that India is the cradle of mankind does not agree with the tale told by its architectural remains, which point to a mixed style derived from various sources. When we consult the oldest written documents, such as Ramajana and the Mahabharata, we find that even in these early times Indian art was

most complicated and rich in forms. Wood, brick, stone, metal, and stucco were already all in use, and each of these materials had brought its contingent of special features; but the one which seems to have had the greatest influence on Indian architecture is stucco, for the overloaded ornamentation of Indian monuments is nothing but stucco-work imitated in stone. We read in the Mahavansi a description of the Buddhist convent Lohaprasad in Ceylon, built about 200 years before Christ. It was a brick building supported on stone columns 12 feet high, and parts of the structure were covered with the most precious materials and the richest ornamentation. The columns were decorated with sculptures of lions, tigers, and other beasts, as well as gods. Such is the description. We may see the ruins of this building: most of the 1,600 columns are still standing. They are roughly-hewn blocks of gneis, and one can perceive that they were all covered with a thick layer of stucco, by which these old-fashioned piers obtained the original sculpturesque ornamentation the old records speak of. Semper is induced by this discovery to venture on the very bold hypothesis that the dolmens and Druid cycles of Stonehenge and Brittany were but the kernel of stucco structures. At all events, the use of stucco for basso-relievos is proved to have preceded stone carving in India. When stone relievos superseded the older work they were covered with a thin coating of painted stucco, so that in outward appearance nothing was changed, only the kernel was of more durable material. In the same way modelling in clay is probably derived from stucco, by serving as a kernel to the same. So are mosaics, painting, and metal plating parts of the clothing system which have succeeded to stucco.

Mesopotamia was the land of embroidery tapestry carpets, which, by being exported, carried the native arts of Mesopotamia far away to all known countries, but specially to Greece, where the pictorial subjects and monstrous creatures which adorned these stuffs were the origin of many a Greek fable, and peopled the Hellenic Olympus. Symbols of mystic meaning, such as the volutes of the tree of life, became architectural features. Moreover, borders, seams, fringes, buttons, knots, and other elements of textile work became common types used in decoration. Such was the influence of the arts of Mesopotamia on ancient architecture.

The civilisation of Mesopotamia took its rise near the Persian Gulf, and then followed the banks of the Tigris and the Euphrates. The oldest buildings of that region are probably those of Chaldæa, the remains of which, insufficient for us to reconstitute the originals, yet suffice to show the early development of the clothing principle. In the ruins of Wurka we see the wall covered with  $2\frac{1}{2}$  inches of stucco, and other walls are encased with mosaic, formed of terra-cotta nails 6 inches long,  $\frac{3}{4}$  inch thick, driven into the surface of the clay, which it protects as well as decorates with carpet patterns. The walls where the surface is denuded show layers of reeds projecting like those still used in China for the retaining of the stucco surface.

Mr. GEORGE WALLIS, of the South Kensington Museum, spoke of his connection with Professor Semper, and regretted the premature close of his friend's career. Semper, he said, had little to do with the formation of the Science and Art Department, and still less with the South Kensington Museum, but had had much to do with the incipient institution at Marlborough House, as also in getting together the collection at Gore House, which he made use of in his lectures at Marlborough House. Mr. Wallis referred to the Parliamentary Committee appointed to consider the relations of arts and manufactures, and the agitation in favour of schools of design, museums, &c., since 1836, and how, consequently, Semper, on coming to England, found a small but sympathetic body of men, and among them the late Prince Albert. The movement regarded textile work more than it did architecture. He himself, from the position he occupied, was desirous to inform himself to the utmost in regard of textile design; but, to his surprise, he found Semper's ideas coincided closely with his own, and that a comparison of notes showed that each of them had travelled over much the same ground—Semper as an actual traveller, he himself by the study of books. Owen Jones and other friends who sympathised with Semper's views did not accept them absolutely; and, though some of his theories as to the origin of design were far-fetched, others were well worthy of consideration and study. In conclusion, he said he should like to see a good English translation of Semper's work. The illustrations would be of the greatest use to textile design.

Mr. SLATER said he had for a long time felt that the subject of evolution, not only of architectural ornament, but of artistic forms of all kinds, was a most fascinating one, and one that opened up a wide and interesting field of study to any one who liked to explore it. Some of Semper's conclusions would seem to many of them rather startling. Though it would not become him to dispute conclusions arrived at by Semper after ransacking the world through, it was open to him to point out certain difficulties that seemed to beset their acceptance. He had only had an opportunity of glancing briefly through Semper's work, but out of two or three main points that struck him, one was the importance attached to textile work. In any inquiry into the history of primitive peoples, students agreed that great assistance was derived from study of peoples occupying an analogous position at the present

time—in other words, of savage tribes. This was the opinion of Sir John Lubbock and those others who had given themselves to the study of primitive races. If, then, they wanted to get an idea of primeval art they must do the same. Travellers all told us that savage tribes had a passion for personal adornment; so that Semper was right in making adornment of the person his starting-point. But an hiatus occurred in treating clothing as the starting-point for the ornament; and Semper said he discovered in the tattoo the same marks as on metal work, and that it showed clothing had originated the ornament on the metal work, but the use of clothing would surely spread from cold countries to warm. The contrary was the case as regarded art. The savage would decorate his person before he came to think about clothing. Nature provided him with pigments to adorn his person, and to nature which prompted the elementary lines and curves of his ornament the savage would look for objects to copy. The difficulty of imitating any ornament or natural object would not necessarily prevent a people without education from trying to imitate it. The circle and the curve were suggested to him in seeing the round orb of the moon, the beautiful curved neck of birds, &c. In fact, this theory would account for the marks and ornament on early stone implements, and it would be strange if we found anything different now among savages, and not on the contrary something very similar. Semper, it seemed to him, allowed his theory to run away with him, and they all know what a procrustean thing theory was in such a case, and how facts had to be squeezed through to fit in with the circumstances. Then, again, the idea was originated that metal was used as clothing to a building, because on many of the tombs in Greece stains from metal and marks of nails had been found, showing that metal work had been hung around them. It might be a mistake, he thought, to say that the metal was put there for the purpose of decoration, and nothing else. In early times metal was extremely rare. Homer, speaking of the possessions of distinguished men, described them as consisting not only of gold and silver, but of other metals. These metals were beaten out into weapons, shields, &c. In every part of the world it had been the custom of early times to bury a man's treasures with him, and it was the most natural thing that the ornamental metal work that had been hung up about the house in life should, at death, be hung about the tomb at death. Later on they would be seen there, and no doubt serve as a copy for decorative purposes. With all respect, he would also say that there seemed a difficulty as to the derivation of columnar decoration from metal-work, and Semper appeared to be arguing from the statue to the column. In the time of Pericles, Phidias, the great sculptor, in his two pre-eminent works, the statue of *Athene* in the Acropolis and the statue of *Zeus*, used ivory, not stone. The exquisitely-outlined columns of stone and marble had nothing in them to show they were copied from bronze work. Then, again, could there be a more extraordinary instance of theory running away with a man than when Semper said that the designs of the textile fabrics exported from Mesopotamia originated many of the Olympian deities? Surely it was more to the point that they were the outcome of the lively imagination of the Greek, who as he wandered through his native woods heard the rustling of the trees, and peopled the woods with fauns, &c.; heard the trickling of the water in the stream, and created the nymphs and dryads; who in the dim twilight converted the strange form of some old tree into the likeness of a god, and who was reminded of Diana, the goddess of hunting, by seeing the crescent moon in the sky with the clouds scouring over its face. Columnar architecture was derived, no doubt, from wooden construction, and the origin of ornamental forms could be found without going so far afield as Semper did. A man would cover his house with reeds that projected to throw off the water. The line of the overlap of the eaves would in first instances be irregular, the ends of the reeds falling at haphazard. These would in later cases come to be arranged in order; and in the cases of sticks, reeds, &c., of unequal length, the process of arranging them in order would, by a mathematical law, evolve certain curves, and hence was derived that beautiful form, viz. the ogee. In concluding his remarks, Mr. Slater said that in architecture, as long as men had free scope to work, the different forms became more and more beautiful and varied; but as soon as—for example, in ancient Rome—art got cramped, began to wane, and when they began to copy the works from other sources, art speedily died out. Mr. Slater then proposed a vote of thanks to Mr. Harvey.

Mr. STANNUS said they were much indebted to *The Architect* for a very interesting account of Semper. In the last paragraph the writer said that "Semper first gave out his theory of the art of clothing as the basis of all art about the year 1831. Carlyle, well versed in German affairs, wrote his 'Sartor Resartus' in 1832. Is it not possible that this book is a skit upon our author's ideas, and that the original of Professor Teufelsdröckh is our friend the late Professor Semper?" That, he thought, was exceedingly interesting, and was most likely correct. Questioning whether certain patterns of ornament could have been derived from textile design, Mr. Stannus remarked that a workman who was given different coloured bricks with which to build a wall would be certain to

arrange the bricks so as to form a pattern. Then, again, certain elements were common to all ornament. Circles, spiral lines, &c., were the common property of mankind, and which men made as soon as they began to make anything. These had their origin in many centres; and because they were found to be common to different countries, it did not prove that there had been any trade or intercourse between those countries, or that they copied from each other. If it showed anything, it was this—that there was a natural tendency in the human mind to make ornament. Mr. Stannus incidentally alluded to the origin of the word "frieze," which owed its derivation to the word "phrygionium," which meant a work exceedingly rich in embroidery. He also alluded to a subject which had of late much exercised the minds of Scandinavian archaeologists. The fact was not known in Semper's time, but the form put down as a serpent was really that of a lion—of a depraved lion certainly, not being such careful work as some of the examples of Scandinavian work at South Kensington.

Mr. WILLIAM WHITE, in seconding the vote of thanks, remarked what a "come down" it was to find that what they had looked on as real truth was real sham, because all ornament and architecture came from stucco. That at least appeared to be the outcome of what they had heard.

The CHAIRMAN put the vote to the meeting, and it was carried by acclamation.

Mr. HARVEY, in responding, said he did not intend to try and defend in a few words the views expressed by Semper in his work, a book that would take three months to read. Fifteen months ago he began the book. Like others, he had had his doubts about Semper's theories, and therefore he investigated every theory put forward. The more he did so the more he got sucked into conviction, till he became, as he now was, a believer. That was the best answer he could give, and he thought any who followed his example would end also in believing. When a Commission was sent by the French Government to report on the South Kensington system, M. Guillaume, one of the Commission, requested him to accompany them and act as interpreter, and on that occasion asked whether he could not translate Semper's work into French for the use of the art schools. He (Mr. Harvey) replied that at present he belonged to the school of architecture militant, and that the translation of the work would suit him better when he got too old for active service. He was exceedingly obliged for the thanks of the meeting; but their thanks were really due to Mr. W. H. White, who had found him out. "My advice is," said Mr. Harvey, "if any of you have anything interesting that you keep it to yourselves, or Mr. White will have it out of you."

#### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE second ordinary meeting of the current session was held at Queen's College on Tuesday evening last, the vice-president, Mr. W. H. Kendrick, in the chair. The following gentlemen were elected members of the Association:—Mr. F. J. Yates as an honorary member, and Messrs. W. G. Midgeley and G. Payton as ordinary members. Mr. J. King James gave a lecture on "Pediments and Gables," which was illustrated by photographs, and by many of the author's own sketches. A discussion ensued, in which the following members took part:—Messrs. W. Doubleday, Franklin Cross, W. H. Kendrick, and Victor Scruton (honorary secretary). After a hearty vote of thanks had been accorded to the lecturer the meeting terminated.

#### MANCHESTER ARCHITECTURAL ASSOCIATION.

AN ordinary meeting of the Manchester Association was held at the Old Town Hall, King Street, on the evening of Tuesday, December 9, Mr. J. S. Hodgson in the chair.

A paper was read by Mr. R. B. Preston, A.R.I.B.A., on "House Sanitation," in which attention was chiefly directed to the consideration of water and water supply. The various sources and methods by which water is usually obtained for the supply of towns were enumerated, and its different chemical properties pointed out. The absorption of gases by water was shown to be a very important property in reference to sanitary inquiries, and one which should not be lost sight of in planning drains, as this fact renders all so-called traps practically useless against the entry of sewer gas. The opinion of Dr. Frankland was quoted in reference to the contamination of water by organic matter, viz., that the danger resulting from the use of such water did not arise from the decomposition of organic matter, but from the risk lest some of it had escaped decomposition.

In the discussion which followed, Mr. F. R. Hawxby mentioned a few of the inconveniences arising from the use of well-water obtained from the red sandstone, which contained a large proportion of lime and magnesia in solution. He also proposed a vote of thanks to Mr. Preston for his paper, which was seconded by Mr. T. Chadwick, A.R.I.B.A. The meeting was also addressed by Messrs. Hodgson, Mould, Woodhouse, and Worthington.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of this Association was held in the Professional Hall, 20 George Street, on Monday, Mr. G. Washington Browne, the president, in the chair. A paper on "Architecture from a Layman's Point of View" was read by Mr. Patrick Geddes. After referring to the causes of the comparative modern indifference to architecture, and seeking to express the various views held by the more sympathetic portions of the public, the lecturer pointed out the close parallelism of methods and results among students of all departments of historical inquiry, of architecture or archaeology, philology or economics alike, as well as with those of the natural sciences, showing that although their progress had in all cases involved minute and laborious special researches, their broad general results were henceforth accessible to all reasonably educated men. The special evolutions of architectural forms (as of obelisk and pyramid from standing stone and cairn) was also discussed in relation to other historic movements of thought and action. The justification of architectural magnificence was likewise outlined, especially on the grounds afforded by the science of economics and of education. The lecturer concluded by defining some of the leading social conditions (economic, political, and moral) under which any school of architecture had to labour, and on which its survival and progress depended. At the close of a discussion which followed the reading of the paper a vote of thanks was accorded to Mr. Geddes.

## LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE annual dinner of the Leeds and Yorkshire Architectural Society was held on Monday evening at the Great Northern Hotel. The company numbered about seventy. Mr. Birchall, F.R.I.B.A., president of the society, took the chair. After the customary loyal toasts, the chairman proposed "The Leeds and Yorkshire Architectural Society." He was glad to say that the society was in a flourishing condition, and that it was doing its duty in the town. He asked those gentlemen who were patrons of art to do something towards the preservation of Kirkstall Abbey, as, unless something was done, that structure would soon disappear.

Mr. G. B. Bulmer, the hon. secretary, who replied, said that so long as the society existed the president and officers would endeavour to maintain it in an efficient state. When he first joined the architectural profession, fifteen years ago, it struck him that architects were on anything but friendly terms with one another, but by means of this society they were gradually making an alteration in that respect. The society endeavoured to cultivate and maintain a proper state of feeling among the members in Leeds. It was divided into three classes—honorary members, associates, and members; and by mutual assistance they were able to carry on a good work. They were greatly indebted to the honorary members for their support, because they had nothing to give them in return; and these gentlemen could have but one desire, to promote good architecture in the town, and to form a connecting link between the profession and the public. The members were banded together in order to maintain their professional position, and to uphold the standard of professional integrity. The associates were students, young architects, and others, who were desirous of improving themselves in the vocation to which they had been called. It was to be hoped that, in the course of time, the society would tend to elevate architecture in Leeds, and to improve the work which came from the design of the architect.

Mr. J. W. Cannon proposed "The Royal Institute of British Architects and Kindred Societies." He said that for many years past he had taken an interest in architectural societies, and in the Royal Institute of British Architects in particular. He had the greatest possible faith in the value of the work which societies of this kind did in promoting good fellowship among their members, in improving the standard of the general morality of the members, and of doing good to the general public. Architectural societies had not been formed merely from selfish motives, and he was sorry to say that architects in this country showed considerable apathy with regard to the assistance they might gain by mutual combination. The Royal Institute, to which they looked as the centre of their body, was to a very great extent isolated from the general bulk of the architects of the country. The Institute, he was sorry to say, studiously ignored the just claims of country architects, and gave them no means of bringing their opinions and views before the general public. Some scheme ought to be feasible for amalgamating the provincial societies with the Institute, which would make that body thoroughly representative of national architecture. Provincial societies did good work in several ways, but those ways were distinct and separate, and did not always tend in the same direction. It was to the Institute that they had always looked for reform, and to it they still looked. If they now looked with more impatience, it was with more hope, because they had present as its President one whom they all delighted to honour. He was a gentleman who for the first time in the history of the

Institute had recognised the claims of country architects, a gentleman who was no partisan of school, party, or section, one who asked not what was politic or expedient, but what was right or wrong. They, therefore, looked to his year of office to be a period of useful and beneficial changes.

Mr. Ewan Christian responded. He agreed with a great deal Mr. Cannon had said, but it depended upon the action of the individual architect whether his profession was respected or not. Each man ought to consider that the honour of the profession at large was entrusted to his own hands. He hoped that the changes Mr. Cannon had suggested would soon be brought about. He felt very strongly on the question of the country members, and their right to have a vote in the affairs of the Institute.

Mr. Holden, Mr. Dunn, and Mr. Jackson also responded. Dr. Gott proposed the toast of "Literature and Art," which was responded to by Mr. Statham and Mr. C. Pebody. Mr. J. Tweedale, A.R.I.B.A., proposed "Law and Medicine," to which Lieut.-Colonel Hartley and Mr. A. M. Robson replied.

In proposing the toast of "Commerce," Mr. John Hepper said that trade in Leeds had been on the whole better, more general, and steadier than in any other town. Although the profits made by individual manufacturers had not been so large as formerly, yet the working classes had had regular employment.

Mr. J. Barran, jun., who responded, agreed with what Mr. Hepper had stated.

## THE FITTINGS IN THE LAW COURTS.

A FEW days ago Mr. Higgins, Q.C., in Mr. Justice Pearson's Court, complained of the inconvenient arrangements for books and papers of counsel, especially the Queen's counsel, and the general bad arrangements of the seats, and asked his lordship whether he could not make some representation to the authorities on the subject.

Mr. Justice Pearson: The arrangements are not less inconvenient for the judge. My present seat is 4 feet 4 inches above the floor. In the old hall of Lincoln's Inn, which was about the best court we have ever had, the dais was 2 feet 2 inches above the floor. The seats of my clerk and the registrar are 2 feet 8 inches below me. I cannot see my clerk—I presume he is here—and I can just see the top of the wig of the registrar, and the inconvenience of communicating with them is exceedingly great. In the next place, in order to address the Bar, and make myself audible to them, I have to stoop forward in a constrained position. If I sit in my place naturally my voice goes up and is lost in space above. I wish some friend powerful enough to induce the authorities to alter the fittings of this court so as to be reasonably convenient, both for the judge and for counsel, would exert himself. To my mind the arrangements of this court are as inconvenient as they well can be.

Mr. Higgins: There is no place, when there is anything like a heavy brief, even to put one's eye-glasses, much less space for books. The desk is narrow; there are no drawers.

Mr. Justice Pearson: In the old hall of Lincoln's Inn the desk or table was 2 feet wide; the desks here when pulled out are only 17 inches. I wish the Bar would represent the matter to the authorities. I am sorry to say that any representation of mine would be unlikely to have any avail.

Mr. Higgins: The fittings are most expensive and inconvenient. One half the money might have been spent and twice the convenience provided. A plain wide table would have been more convenient than these movable narrow desks now in front of us.

## BOLTON MASTER BUILDERS' ASSOCIATION.

THE seventh annual dinner of the Bolton Master Builders' Association took place at the Swan Hotel on the 11th inst. The president of the society (Mr. John Smith) said he was sorry there was not a larger attendance, but hoped that trade would revive all round so that when their annual gathering came round again they might be in a better position. There were members who were absent through ill-health, and he sincerely hoped they would soon recover.

The usual loyal toasts were proposed.

Mr. John Ratcliffe proposed "The Army, Navy, and Auxiliary Forces." Mr. Ratcliffe proposed "The Mayor and Corporation of Bolton," which was responded to by Mr. J. J. Bradshaw.

Mr. W. Coope, of Farnworth, proposed "The National Association of Master Builders of Great Britain," saying that the association was one not only of importance but of great use. He was sorry to hear of the falling-off in the number of their members, because he felt the time would come when the necessity of unity would be felt amongst them. They ought all to work together and endeavour by standing shoulder to shoulder to better their position.

Mr. G. H. Marsden, replying to the toast, gave an account of the work done during the year by the National Association. He referred to the effort by Mr. Burt to secure more onerous restrictions through the Employers' Liability Act, pointing out that the

alterations would have been unjust, and that they had been successfully opposed. The association had done a great amount of good during the seven years in which it had been established, and he contended that it deserved the support of all the local associations. It behoved all the associations and all the members of those associations to be united together, so as to be ready for any struggle which might come. Locally they wanted builders of all grades to join them, they wanted merely personal feelings to be sunk, so that, working altogether, they might improve their status and their general position.

Mr. Marsden proposed "The Bolton Master Builders' Association."

This having been acknowledged, the chairman briefly responded. He said there were about forty members at present, which was a less number than formerly. Some gave one reason for the falling off and some another, but his opinion was that the falling off was due to the fact that everything had been in a settled state. When there was no question between the employers and the employes it seemed that the members of the association ceased to attend its meetings. Of course there was other and very important business. Questions arose between architects and builders which might very well be gone into by the association if the members would bring them before the committee. Since that association had been formed they had found that all questions between employers and employes could be settled without strikes. That was a very good thing, because strikes caused a complete waste of time, time which could never be recovered; and if for no other reason than that it prevented strikes and lock-outs, he thought the Master Builders' Association was worth backing up and supporting.

Mr. W. Townson proposed "Our Guests," which was responded to by Mr. Ashcroft, of Wigan. The toast of "The Architects of Bolton" was responded to by Mr. Pilling (of the firm of Messrs. Cunliffe & Pilling) and Mr. J. J. Bradshaw. The toasts of "The Officers of the Association" and the "Town and Trade of Bolton" were also drunk.

#### CHURCH BUILDING IN NORTHAMPTON.

THE following report was read at the annual meeting of the Architectural Society of the Archdeaconry of Northampton, which was held last week:—The cases of church building and restoration brought before your committee in the past year have been unusually few. But churches needing substantial repairs in the archdeaconries are now, happily, rare, and where such do occur the cause may fairly be ascribed to lack of means rather than to lack of zeal on the part of those concerned. That nothing has yet been done at Irthlingborough is probably due to the extreme difficulty of raising in a poor parish the large sum which must be spent upon the tower. This has been pronounced by Mr. Pearson, R.A., by Mr. Peacock, the architect who restored the nave, by your committee, and by a committee of the Society for the Protection of Ancient Buildings, to be in a very dangerous condition, and ought to be taken down and rebuilt wholly or in part, or repaired at a cost equivalent to rebuilding. While sympathising with the parish authorities in the hard task which lies before them, your committee cannot but think the raising money for, and placing an organ in the newly-restored church, an act of very doubtful propriety under existing circumstances, when the fall of the tower and lantern might wreck church and organ at any moment, and once more your committee venture to press upon the authorities at Irthlingborough, the absolute necessity of taking immediate steps for securing the safety of both church and tower. In the case of Earls Barton action has been taken. The parochial committee there obtained the opinion of Mr. Pearson, R.A., on the state of their tower. He takes a more favourable view than Mr. Carpenter (who deemed underpinning and other expensive works necessary), and recommends only repairs which will cost comparatively little. These are now being carried out by the parochial committee, and it remains to be seen whether the bells can be rehung and used with safety in the structure, which is well known is very seriously fractured. The following plans have been laid before your committee during the year:—Nassington Church: Rev. D. W. Barrett, vicar; Mr. Traylen, architect. Church consists of nave, chancel, aisles, tower, and spire. The spire, a fine example of Decorated work, crocketed. The body of church shows various dates up to Norman times. At present it is only proposed to repair and point external and internal stonework, to repair aisles with local stone, and to reseal throughout in oak, copying the old bench ends. It was recommended that the backs showed to be slightly inclined should be made vertical, and the bookboard lowered.—St. Mary, Far Cotton: Rev. C. J. Gordon, vicar; Mr. Holding, architect. This is a new church, Early English, consisting of nave, north and south aisles, and chancel, terminating with semicircular apse, north and south porch, opposite westernmost bay of nave. It is proposed to vault with Bath stone the chancel, nave, and aisles. The committee objected to this, also to the small tower and spire proposed at east end of north aisle, and suggested in preference a flèche or bell-turret, and to defer erection of tower until funds were

obtainable for a larger one, which they suggested might be placed advantageously at the west end on the site of the north or south porch.—Moulton Church: Rev. O. R. Walker, vicar; Mr. E. Law, architect. This fine and well-known church was visited by a sub-committee to advise with reference to its thorough restoration. Although the plans of the architect were generally approved, your sub-committee recommended that as the money in hand was a small amount, the underpinning and general repair of the tower should be at once taken in hand, leaving the question of rebuilding a large portion of the north arcade, which seemed to be in very bad condition, for further consideration and examination. The committee preferred to follow the original design of the old nave roof rather than adopt a new design, and to retain the old paving and levels as far as practicable. A large sum must necessarily be raised even for the general repairs of so large a building; amongst these the pointing of all the external work requires immediate attention.—Staverton Church: Rev. H. B. Hodgson, vicar; Mr. Townsend, of Peterborough, architect. An interesting church consisting of nave, north aisle, chancel, and western tower, with an elegant arcade of seven bays of the Middle Pointed period. At present it is proposed to repair the roof, to reseal the area, and to remove the surrounding soil and effectually to drain the building. The details of the seats were objected to by your committee, and upright backs and square plain bench ends recommended. A sub-committee of the society was invited by the vicar (the Rev. J. P. Carey) to visit the church of Rothersthorpe, to advise how a few pounds could be best spent on it. They made a report in writing to the vicar and churchwardens. A curious head of cross, which has been preserved by the churchwarden, has been by him placed in the church. Other works have been done in various parts of the diocese, which have not been brought before the society. What is virtually a new church has been erected at Silverstone, under the direction of Mr. St. Aubyn, architect. An enlargement and other alterations have been made at Sulgrave Church, under the same architect. One of our members measured and made notes of the church before the alterations. With reference to "The Queen's Cross," the committee which was formed last year report that 320*l.* will be required for its repair, which sum includes the renewal of nearly half of the flight of steps up to the Cross, the levelling of the ground around it, and the careful restoration of the mutilated and decayed portions of the superstructure. The broken pedestal at the summit will be left as it is. The committee having only received up to the present time promises to the extent of one-third of the sum required, will be very grateful for further contributions, however small, to enable them to commence a work which is necessary, mainly for the preservation from ruin of a memorial of very great historical and architectural interest. It has been proposed, and considered desirable by your committee, that a record of church plate should be made in the Peterborough diocese, and the necessary steps for carrying out the plan is under the consideration of a sub-committee.

#### BELLHANGING.

A MEETING of the Architectural Section of the Glasgow Philosophical Society was held in the rooms of the Institute, Bath Street, on Monday, Mr. James Sellars in the chair. Mr. James A. Walker read an exhaustive paper on "Bellhanging" as applied to dwelling-houses and offices, and explained the mechanical, pneumatic, and electric systems of hanging bells. In the course of his address he said the rapid advances which had been made, and were still being made, in electricity brought quite a large number of appliances to bear on the subject of electric bells. They were, however, far behind their Continental and English neighbours in the general introduction of electric bells; but it was questionable if these would have been so fully developed had the mechanical system been carried out by them with the same thoroughness in which it had been done in Scotland, and for which thoroughness Scotland stood pre-eminent in regard to many branches of the trade. After explaining the different systems, he said, taking all things into consideration, the mechanical bell still held an equal, and, he believed, a superior, position to either of the others. It had the advantage of being distinguishable by sound, it did not require periodical attention as in the case of electric bells, and for good household work was therefore more convenient. Pneumatic bells, on the other hand, were invaluable in the case of single-call bells, while electric bells were pre-eminent in adaptability, as they could be used in every form and under all circumstances. There was nothing neater or more compact than the electric indicator, and electric bells were undoubtedly best for large hotels or public offices, where quietness was to be maintained and where numbers of signals had to be collected into small space. While it was difficult to give the comparative prices of the three systems, as what would be found cheapest under one system would, under slightly different circumstances, prove much more costly, he thought, all over, the mechanical bell was from five to ten per cent. cheaper than the pneumatic or electric. In noticing the various adaptations of bellhanging, he mentioned that bells could

be made to act as burglar-alarms, aid in the detection of crime, act as fire-alarms, &c. He referred, in conclusion, to ecclesiastical bells, and in that connection said it was a great mistake to suppose, as many did, that bell music every hour, quarter-hour, or even at the half-quarters, was an interruption. Any one who had heard the musical chimes of Belgium would hold a contrary opinion. Belgian founders were still far ahead of them, and excelled in beauty of workmanship, although it did not always follow that the finest-looking bell gave the best sound. It was, however, to be hoped that the day would come when their own country would hear the carillons ring as sweetly as did those over the Low Countries. Mr. Walker, in the course of his paper, gave illustrations of the working of a number of ingenious bells by the three methods. A short discussion followed. Mr. Walker was afterwards thanked for his paper, and a vote of thanks being awarded the chairman, the meeting separated.

## THE BUILDING TRADE IN EDINBURGH.

THE building trade of Edinburgh during the year which is about to close has passed, says the *Glasgow Herald*, through a period of continuous depression. Builders at the beginning of the year had hopes of more prosperous times, but as the season advanced they found no improvement. Ever since the failure of the City of Glasgow Bank the trade has been in a depressed state, from which it seems disinclined to recover. Prior to that unfortunate event builders and their employes were enjoying great prosperity. Several extensive areas of ground in healthy suburban localities had been thrown open, and the feus were taken up with remarkable speed. Large tenements were quickly built and as quickly for a time were tenants or owners found for them. Prices were highly satisfactory both to the employer and the employed. Houses which cannot now bring more than 400% were then sold readily at 500% or 550%. Workmen in several trades received as much as 1s. per hour for their labour, and had often overtime when houses were near completion. The inevitable result of this high pressure was a reaction, which would have occurred without any bank failure, although perhaps not so soon. Had builders taken advantage of the warning which the bank failure offered in time and put a check upon their operations they would have been better employed during these subsequent years. The majority, however, continued their extensive work, and the result was over-production. What gave them some encouragement at the time was a very general tendency towards residence in these newly-opened suburban localities in preference to the north side of the city. Since 1880 there has been very little variation in the state of the trade. This fact is brought out by the returns of the Dean of Guild Court. In the official year 1880-81 warrants were granted for 102 self-contained houses and 113 tenements; in 1881-82 the figures were 82 self-contained houses and 72 tenements; in 1882-83 they were 60 self-contained houses and 65 tenements; and in 1883-84 they were 114 self-contained houses and 87 tenements. The returns of the Court prior to 1880 are of no value for comparison, because it was only in 1879 that the city boundary was extended so as to include the suburban localities, where the great bulk of the building was going on. A noticeable feature of this year's work has been the erection of an increased number of self-contained houses. These houses for the most part have been built in the valley on the south side of the city, which runs along from Craiglockhart Hill to the Dalkeith Road. It is through this valley that the newly-opened Suburban Railway passes. While a considerable number of houses are detached, and are surrounded by gardens, many of them are built together in a continuous row. In several instances the old English style of architecture, with its small windows and broken gables, has been adopted, giving to some of the little districts or groups of houses a very quaint, old-fashioned character. On an average these newly-built self-contained houses have been well let, although many of them are still without occupants. Now that the Suburban Railway is in operation, and Blackford Hill is about to be thrown open to the public, it is expected that a demand for property in this locality will be excited. The trade in tenements this year all over the city has been exceptionally dull. There has been almost no speculation by those outside the trade, while builders have engaged in it very moderately. One firm who during the past six or seven years have been building at the rate of half a dozen tenements each year, were content with two this year; while many others have confined themselves to jobbing work or small contracts. In Warrender Park, which in a sense has been the centre of the tenement trade for several years, there has been little or nothing done. There are vacant feus all over the park, but no one seems inclined to build on them, at any rate just now. At Morningside some little activity has prevailed towards the close of the year. At present six tenements are being finished there. A striking contrast to this is to be found at Merchiston, where a large piece of ground, formerly used as the cricket and football field for Merchiston Castle School, was laid out for streets and crescents. A start was made with the building two or three years ago, and some progress was made, but now there is a com-

plete standstill. Nearer Bruntsfield Links is a piece of ground on which Messrs. Beattie are building perhaps the best class of tenements in Edinburgh. The front elevation is quite of an ornate character, while the houses themselves are all large and well finished. In the present state of the market, however, it is doubtful whether they will command the price they deserve. There has been some tenement building also in the neighbourhood of Parson's Green and Leith Walk, but nowhere has there been any great activity.

Looking at the building trade from the workman's point of view, there is to be seen the same depression on every hand. Wages during the year have averaged from 6½d. to 7d. per hour, which means less than 30s. per week. Work, too, has been very scarce. In Edinburgh, during the last fifteen or twenty years, there has always been going on some "big job" in the shape of a public work or large institution which afforded employment to a large number of workmen of different trades. There were the new Post Office, Fettes College, the Museum of Science and Art, the Bank of Scotland, the Royal Infirmary, the new University Buildings, and the like, all of which took several years for their erection. This year the only work of that kind has been the reconstruction of Calton Gaol. The employment of labour there, too, has been restricted, through the work having to be done in portions at a time. There were hopes that the Government would proceed with the completion of the Museum after they had included the grant in their budget, but no movement has yet taken place in the matter. Next year will be fortunate in having the erection of buildings for the National Portrait Gallery. Another reason for the scarcity of work, apart from the general depressed state of trade, is to be found in the fact that during the year there have been virtually no new public schools built. In this connection there is hope for the future. The School Board for some time have felt the need of more school accommodation, and at present are on the outlook for sites in more than one locality. Setting aside future prospects, and speaking only of the past year, it must be said that workmen in the building trade have had a pretty hard time of it. According to the testimony of a good authority a large number of men during the year have left their trade, not to emigrate, but to act as cabmen, railway porters, tramway car drivers and conductors, and the like. The same authority is of opinion that very few men have emigrated. During the summer months there was the usual stream of strangers into the city, but in only one or two instances did they obtain employment for any lengthened period. Masons early in the year were pretty well employed, and the same might be said of joiners. The latter, along with plumbers, had a good deal of work in improving houses on the north side of the city. Since these houses were built sanitary science has made considerable strides, and new systems of ventilation and heating have been applied in the erection of new houses. The proprietors of the older houses in order to keep abreast with the times and find a market for their property have been busy introducing these new systems. In this way plumbers especially have found a good number of odd jobs. Plasterers, on the other hand, have been very dull throughout the whole year.

## A RAILWAY CONTRACT DISPUTE.

THE award of Mr. G. M. Cunningham, C.E., has been given in the case between the Cathcart District Railway Company and Messrs. Coghill & Co., which was heard before him as arbitrator. The line was to be an addition to the railway system of Glasgow, and the contract provided that the company should give the contractors the land necessary for the construction of the works within two months after the date of the contract, unless they were prevented from so doing by delays connected with the proceedings necessary to acquire the ground, and other such causes, in which event the contractors were to have an extension of time to complete the contract, but were not entitled to rescind it. The company refused to give the contractors more ground than they thought necessary, on which the contractors abandoned the works, and raised an action for the price of the work done, and for damages for breach of contract. The case was remitted to Mr. Cunningham, and both parties lodged claims. The contractors claimed the price of their work as executed, and the plant taken possession of by the company, besides damages; while the company claimed over 40,000%, as the difference between the contractors' price and that at which the contract was re-let, the cost of taking down walls said to be defective, &c. Mr. Cunningham finds that the company's failure to give the ground did not arise from any of the specified causes; but it seriously hindered, if it did not render impossible, the proper execution of the works; and that it therefore constituted a breach of contract which entitled the contractors to abandon the works. He therefore finds Messrs. Coghill & Co. entitled to payment of 17,194% for work done and plant taken over, with 100% for breach of contract; but under the deduction of 275% as the cost of repairing some properties adjoining the line, which were injured during the construction of the works, and of the payments made to account. The company's claims are otherwise set aside, and they are found liable in the costs of the arbitration.

## STONE-QUARRYING IN CHINA.

AN interesting report on the products of the Ichang consular district in Central China has been prepared by Mr. Charles Gardner, who has been a resident for over twenty years. He says that all over that part of the country there are large and small lime-kilns. Lime-stone is much used for foundations of houses and walls. At the quarries at Ho-ai-tze, some eighteen miles above Ichang, on the Yang-tze, over one hundred men are employed. The quarry-men have an agent in Ichang, and will sell the stone either at the quarries or in Ichang. At quarries the stone is  $2\frac{1}{2}d.$  the square foot, delivered at Ichang,  $3d.$  The quarry-men can guarantee to supply 2,000 feet a month, in addition to what they supply to their regular customers. The stone is rough-hewn, but they will supply masons to smooth the stone at  $9d.$  per day per man. The hill belongs to a family named Hsu, to whom the quarry-men pay an annual royalty of  $17\frac{1}{2}l.$  10s. for the right of quarrying. The stone is mountain limestone, of a dark grey colour, with occasional layers of partly crystallised stone. The men declare that fossils are never found there. The stone when cut is sent down a mud shoot to the water's edge on wooden slides. When the shoot is not steep enough for the stone to slide of itself, the stone-cutter drags it by a rope round one shoulder; to the rope is attached an iron hook, and the hook is hooked to an iron staple fastened to the slide. The man's breast is protected from the cutting of the rope by a padded waistcoat. Accidents from the stones shooting off the slides and striking the quarrymen are of frequent occurrence. In the quarries at Kwang-mên-Shan, on the Ching river, over 500 men are employed in five associated gangs. The stone is red and blue mountain limestone, and is largely exported in native boats to Hankow, Wu-chang, Yochow, Chang-sha, &c. The stonecutters pay a royalty to the owners of the hill, and the output then belongs to the quarrymen. The five associated gangs have elected a head man, who divides the earnings, and to whom all the workmen have to pay implicit obedience. All the stone cut is sold to a guild of traders, to whom the ordinary purchaser has to apply; after he has bought his stone he has to apply to another guild, which has the monopoly of transporting it from the quarries to Itu, Hankow, or wherever else it may be required to be sent. In some places, the water trickling over limestone covers stalks and leaves of plants with a thick coating of lime, and forms stones of curious shape, which are cut out and planted with ferns, ceneraria, &c. About  $350l.$  worth of these rockeries are sent every year by the steamer to Hankow. As they do not pay duty, they do not appear in the Customs Returns.

Shaly slate is found running for miles under the red clay, and white limestone of the coal-producing hills. A solid slate is found at the top of the white limestone cliffs of the Ichang Gorge; at this spot many of the houses of the natives are roofed with slate. There used to be quarries in the caves near for obtaining slate to make native ink palettes, but they have been recently closed for fear of the roofs of the caves giving way. Granite and syenite exist about 20 miles up the river at Nanto, where they are chipped into mill stones, mortars, cattle troughs, &c.

There is a trade in fossils. The orthoceras found in slate at Nanchich-ah, about 40 miles north-east of Consulate, is cut, and is either framed as a picture or made into ornamental furniture. The same holds good of the ammonites, which are called Kosmos stones, from their resemblance when polished to the Chinese symbol for Kosmos. No duty is yet charged on the export of these fossils. They do not, therefore, appear in the trade returns. The tools used by the fossil-cutters are a saw and chisel; they prod about the slate until they find an orthoceras which they think will be perfect; they then cut out a slab, which they saw into two or three thin planks, so that the orthoceras looks like a white picture of a pagoda on a black ground. The orthoceras fossil is most common in the neighbourhood of Nanchich-ah, but other fossils, such as ammonites, also exist in great numbers. There are also fossil bivalves, called by the Chinese "stone swallows." The natives believe that these fossils fly about underground in the same way as the swallow flies in the air. The fossils being so close together, in a region at least thirty miles long, is remarkable. There is hardly a cubic foot of limey slate which does not contain a fossil or fragment of one. Mr. Gardner also came across agates, syenite, and a very peculiar formation of red sandstone, which lay upon the mountains like tessellated pavement, each piece of sandstone being diamond-shaped, and about four inches across.

The Kwan-yin-Shan Mount has several coal shafts in it. They are nearly horizontal, 3 feet high, 5 feet wide, and are supported by log stanchions. They are provided with wooden boxes on slides to raise coal to pit's mouth. The depth of the shafts is about 200 yards. The coal is in very thin seams, from 1 to 6 inches, very gaseous, but dirty and friable. About six men work in each shaft. Each man can, if he works his best, turn out  $1\frac{1}{4}$  tons a day. The price of the coal at the pit's mouth was about  $2s. 6d.$  a ton. The Kwan-yin hill belongs to the Liu family, which charges a royalty of about  $7\frac{1}{2}l.$  for each shaft. This royalty once paid, the output belongs to the miners. There are never more than one hundred men working at once on the hill, and generally much fewer. The output is rarely more than 80 tons a day; taking the whole year round, it is not much more than 25 tons a day.

The miners have no dread of fire-damp, nor have any of the shafts been rendered unworkable by water. Coal, however, has not been long discovered here, so that none of the shafts are very deep. The lamp the miners carry is made of copper; it is unprotected. A rough chisel for picking out the coal is the only other tool used. On the whole road to the mines the formation of the hills was shaly slate below, then mountain limestone, then red clay, then white limestone. The shafts of the mines were cut in the white limestone. The coal is carried from the pits to Mosze, a distance of twelve miles by nearest road, by baggage mules. The price of the coal at Mosze is about  $12s. 6d.$  per ton.

## The Dome of St. Paul's.

SIR,—As the "one full-fledged Academician" who took part in the discussion on the decoration of the dome of St. Paul's, to whom Mr. Lewis F. Day refers in your last number, may I be allowed to protest against having words put into my mouth which I never uttered. The only words I did use in connection with Stevens's design were correctly given in the "Report of the Proceedings." They are as follows:—"I earnestly hope that before the mode of decoration of the dome is finally and irrevocably settled, the incubus of Mr. Stevens's design may have ceased to overcome the minds of those who have to decide. I recognise great cleverness and wonderful imitative faculties in the design in question, but I am convinced that any arrangement founded on it will prove impracticable and eminently unjust to the artists who may be commissioned to carry it out." Mr. Day makes me "express a hope that the objectionable design might be removed to the obscurity from whence it came," &c. &c.

The *Architect* is so much read that I think I ought to be allowed to state that I never expressed a hope of this kind, nor did I say anything which could be twisted into any approach to it. The phrase is a pure invention on Mr. Day's part. I simply expressed an opinion that Mr. Stevens's design, or any modification of it, would be practically unsuited to the decoration of the dome, and to this opinion I adhere.

In party warfare (to which low level Mr. Day would degrade the discussion) it is I suppose justifiable to abuse one's opponents, but hardly to misquote their words. Such tactics invariably recoil on the heads of those who use them.

I remain, your obedient servant,

3 Hall Road, St. John's Wood:

E. ARMITAGE.

December 15, 1884.

## CHURCH BUILDING AND RESTORATION.

**Emmanuel Church, Holloway.**—On Saturday last, the 13th inst., the new Church of Emmanuel, Hornsey Road, Holloway, was consecrated by the Bishop of London. The church holds nearly 1,000 worshippers. On plan, the building consists of nave and chancel, north and south aisles, baptistery, and vestries for clergy and choir. The style of architecture adopted is First Pointed, carried out almost entirely in red brick, no stone being used externally except for the ornamental niche on the entrance elevation, which is executed in red Corsehill stone. Internally, Bath stone is employed for shafts, caps, bases, corbels, and the chancel arch; the remaining arches, labels, and string-courses being entirely of moulded red bricks made to the architects' full-size details by Mr. James Brown. The works have been carried out by the builders, Messrs. Taylor & Grist, of Aylesbury, from the designs of the joint architects, Mr. Frederic R. Farrow and Mr. E. Swinfen Harris, F.R.I.B.A., of 32 Craven Street, Strand, W.C. The whole of the footways of the church are laid with marble mosaic by Messrs. Diespeker & Co. The wrought-iron hinges, finials, railings, and gas fittings have been executed by Messrs. Shrivell and Mr. W. Downing. The heating is effected by high-pressure hot-water pipes supplied by Mr. R. Renton Gibbs, and a system of ventilation has been devised by the architects on the natural means of temperature-difference and assisted by one of Boyle's extractors. The acoustics of the church are based upon some recent investigations in a new direction by Mr. Farrow, and are very successful, it being found easier to read, speak, and sing in the new building than in the temporary iron church holding only 300.

**Govan, Glasgow.**—The foundation-stone of the new Govan parish church was laid on Saturday the 6th inst. by Mrs. John Elder. The new church consists of a vestibule, over which is a gallery; then a great nave, with narrow side aisles used only as passages. A transept on one side; a choir with side aisles, one of which is for the organ; a hall or chapel capable of holding 250 people, and a tower and spire on the north side, isolated from the church, but connected with it by a corridor. Advantage is taken of a fall in the ground to provide vestries, session-house, and

beadle's apartments under the choir. The bulk of the congregation will be seated in the nave, the remainder in the transept and choir aisle. The nave is 98 feet long and 41 feet broad, and the aisles are 5 feet wide. The choir is 30 feet long and 22 feet broad. The hall is 40 feet long and 20 feet broad. The total height of the tower and spire is 258 feet, and the width at the base is 35 feet. The architecture is of an Early Gothic. All the internal features are formed with dressed stone, and it is proposed to line all the intermediate spaces with brick. The roofs throughout are timber, covered outside with green slate and red ridges. The cost of the new church will be 17,000*l.*, but this does not include the tower and spire. The contractors are:—Mason and joiner work, Messrs. J. & D. Meikle, Ayr; slater work, Mr. A. D. McKay, Glasgow; plumber work, Mr. John McFeat, Govan; plaster work, Mr. R. A. McGilvray, Glasgow; gas-fitting, Messrs. R. M. Easdale & Co., Glasgow; measurer, Mr. W. H. Dinsmore, Bath Street, Glasgow; and clerk of works, Mr. George Kermack, Glasgow. Dr. R. Rowand Anderson, of Edinburgh, is the architect.

**Bridlington Quay.**—On Wednesday a new parish room in connection with Christ Church, Bridlington Quay, was opened by a sale of work. The buildings are in the Early English style, from designs by Mr. J. Earnshaw, architect. The large room is heated by a Gurney stove, and ventilated by Boyle's exhaust ventilator. The whole of the works have been carried out by Mr. Thos. Gray, at a cost of 550*l.*

### SCHOOL BUILDINGS.

**Stillington.**—New Sunday schools have been opened. Plans for the enlargement of the Church schools were early in the year prepared by Mr. J. W. Alexander, architect, of Middlesbrough, which showed a new wing 30 feet by 22 feet, and a class-room, kitchen, and places for the storage of surplus furniture, &c. The work has been carried out as a memorial to the late Rev. W. Cassidi, vicar of Grindon, founder of the parish of Stillington.

**Berry Brow.**—The memorial-stones of a Methodist chapel have been laid. The building will consist of two storeys, on the lower of which will be a number of class-rooms, providing accommodation for 80 or 90 scholars, and a preaching-room for 110 persons; and on the upper one will be the chapel, which will accommodate 600 persons. The architect is Mr. J. H. Burton, Ashton-under-Lyne. The amount of the contract is about 2,700*l.*

**Leeds.**—Wesleyan Sunday schools erected at Roundhay have been opened. The buildings are of stone, and designed to harmonise with the chapel. They have been erected by Mr. G. B. Thain, contractor, Wetherby, from the designs of Mr. G. F. Danby, architect, of Leeds.

### ARCHÆOLOGY.

**Discovery of a Roman Dwelling.**—Explorations in a field near Purwell Mill, Hitchin, Herts, have brought to light extensive remains of a Roman dwelling. Its existence has long been suspected, numerous Roman coins, broken bricks, and pottery having at various times been turned up by the plough. A room, with a tessellated pavement in a fair state of preservation, has been opened to view. The walls of the dwelling were built chiefly of large flints. The flints had been roughly squared, and presented somewhat the appearance of large bricks. The dwelling originally consisted of several rooms, as the foundations clearly showed, and in one place there had evidently been a hypocaust or furnace for heating the house with hot air. Several of the peculiar tiles used to form the oblong flues were found scattered about. The tessellated pavement is in red and white, chiefly of the former colour, and the *tesserae* or squares are rather large and coarse. From this fact and the size of the rooms it is inferred that the dwelling was a farmhouse rather than a villa. Several coins of the time of Constantine II., Emperor of Gaul and Britain, and of Magnentius, were found, struck probably about A.D. 340. A great quantity of broken pottery has been turned up, and a small piece of a glass urn. Large ridge-tiles were used for the roof, and many of these lie just as they fell 1,500 years ago. A lane, which in Roman times probably connected this district with ancient Verulamium (St. Albans), runs close by the dwelling, which appears to front it. Numerous cinerary urns and articles of Samian ware have been dug up in the neighbourhood of Hitchin, but this is the first instance of a Roman dwelling-place being found in the locality.

**The Ancient House, Stratford-on-Avon.**—This remarkable house in High Street, which is one of the few buildings in Stratford that remains in precisely the same state as in the days of Shakespeare, has lately shown signs of giving way. The handsomely-carved gable front, which bears date 1597, was on Saturday shored up with timber to prevent its falling. The front has so pressed upon the window that the casement is forced out of position, and the top has bulged outwards, breaking several small panes of glass. The house is one of the most interesting sights of the town. Some fears have of late been entertained as to its safety.

### GENERAL.

**Mr. T. Chatfield Clarke, F.R.I.B.A.,** will on January 1 take his son into partnership.

**The Pictures by M. Jundt,** which were sold lately at the Hôtel Drouot, in Paris, realised 38,200 frs. The painter was killed in the early part of the year by falling from a window.

**Mr. John Brett, A.R.A.,** is painting for the next Academy Exhibition an extensive view over the hills at Sark. The *South-westerly Gale on the Cornish Coast*, one of Mr. Brett's contributions to the last exhibition, will shortly be engraved.

**M. Legros,** Slade Professor in the University of London, intends to give a course of lectures on the art of etching, from illustrations in the department of prints and drawings at the British Museum.

**The Statue of Queen Anne** in front of St. Paul's Cathedral is to be replaced, at the cost of the Corporation of London, by a copy in Sicilian marble, which will cost 1,800*l.* The existing statue was executed in 1712 by Francis Bird, who was paid 1,180*l.* for the work.

**A Second Competition** has to be opened for the decoration of the Salle des Mariages in the Mairie of Courbevoie, in the environs of Paris. Fifty-seven designs were sent in by French painters, but the judges considered that all were inadequate.

**The Annual Conversazione** of the North London School of Art took place on Monday. Mr. Phil. Morris, A.R.A., who distributed the prizes, said there were 200,000 art students in the country. The influence of art in a home was an influence for good; and these schools were doing a great work in spreading the love and knowledge of art both at home and abroad.

**Sir Henry Dryden** opened on Wednesday evening an International Photographic Exhibition in Northampton Museum Galleries. Specimens have been sent from all parts of the world.

**Mr. Barbour,** architect, has been commissioned to prepare a report on the means of egress at the theatre and public halls in Dumfries.

**Mr. Hay,** architect, has prepared a design for the proposed new royal pew in St. Giles's Cathedral, Edinburgh. The platform is 32 feet long, and the canopy 40 feet high.

**Mr. James Lessels** was on Tuesday re-elected architect to the Edinburgh Improvement Trust for the following year.

**The Plans** for the remaining wing of the Edinburgh Museum of Science and Art are now ready, and estimates being taken for the building.

**The Fund** for the restoration of the spire and church of St. Michael's, Coventry, has now reached over 19,600*l.*, so that only about 400*l.* remains to be obtained before Mr. George Woodcock's offer of 10,000*l.* can be accepted.

**The Bridgewater Navigation Company,** at a meeting held on Wednesday in Manchester, decided to adopt a scheme for improving the navigation of the Rivers Orwell and Mersey, at a cost of 324,000*l.*

**A New Dock,** which has cost 120,000*l.* to construct, was opened at Boston on Monday last.

**The Alexandra Palace** is to be lighted by the Gülcher Electric Light and Power Company.

**A New Board School** is to be erected in Infirmary Street, Edinburgh, for children in the south-eastern part of the city.

**A New Certificate** has been granted by the Board of Trade to the effect that the International Inventions Exhibition is an international exhibition, and all the protection accorded from May 1 to inventions under the original certificate will be secured, in addition, from March 1 till May 1, *i.e.*, during the time in which the exhibits will be received and arranged.

**A Design** by Mr. Neil Macara, of Darlington, has been selected for the proposed new buildings of the West Hartlepool Young Men's Christian Association.

**The Edinburgh Forestry Exhibition** has produced a surplus of 300*l.* after payment of expenses, which it has been suggested should be appropriated as the nucleus of a fund for founding a chair and museum of forestry at the Edinburgh University.

**The Old Town Hall,** Grangemouth, has been sold by auction for 1,290*l.* to a draper.

**The Art Gallery** at Leicester is to be opened on January 6 next.

**Mr. R. W. Johnson,** Surveyor to the Local Board of Kettering during the last twelve years, has died suddenly at his residence, Melton Mowbray. Mr. Johnson's practice as an architect at Kettering extended over a period of twenty-four years, and most of the dwelling-houses and factories there have been erected from his designs.

**The Belfast Plasterers** have protested against the contract for the plastering of the Free Library being given to Mr. James Caird, of Glasgow, whose tender is said to have been 2,000*l.* in excess of that of Messrs. Martin's, who are the general contractors.

**The Erewash Valley Ironworks,** which cost originally 80,000*l.*, were sold by auction on the 10th inst. for 9,100*l.* The property comprised four large furnaces, sixteen cottages, and twenty acres of land.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, DECEMBER 20, 1884.

### NOTICE.

The next Number of THE ARCHITECT will be published on Wednesday, December 24. All advertisements intended for insertion in that Number must reach the Office not later than 5 P.M., on Tuesday, December 23.

### COMPETITIONS OPEN.

**CHELSEA.**—Feb. 25.—Plans are invited for Additions to the Vestry Hall. Premiums of 100, 50, and 30 guineas. Mr. J. Elsdell Salway, Clerk of the Vestry, King's Road, Chelsea.

**FALMOUTH.**—Dec. 24.—Plans are required for the Erection of Wesleyan Sunday School Premises, with Class-rooms, &c. Mr. F. L. Earle, Falmouth.

**KING'S NORTON.**—Jan. 15.—Plans for the Erection of Four Cottage Homes upon Lands situate at Shenley Fields are required. Mr. Ralph Docker, Clerk of King's Norton Union, Colmore Row, Birmingham.

**KING'S NORTON.**—Jan. 15.—Plans are invited for the Erection of a Laundry, at the Workhouse, Selly Oak. Mr. Ralph Docker, 57 Colmore Row, Birmingham.

**NEWCASTLE-UNDER-LYME.**—Dec. 31.—The Corporation offer Premiums of 100 guineas, 30 guineas, and 20 guineas, for first, second, and third selected Designs for Public Baths, Free Library, and Assembly Room. Mr. James Pattison, Borough Surveyor, Newcastle-under-Lyme.

### CONTRACTS OPEN.

**ANDOVER.**—Dec. 23.—For Building Dwelling-house. Mr. Henry Edwards, Winchester Street, Andover.

**ASPATRIA.**—Dec. 20.—For Building Oil house, Granary, Coal-house, Hay-barn, Shop, Slaughter-house, and other Buildings. Mr. Henry Cooper, Co-operative Stores, Aspatria.

**BERMONDSKY.**—Jan. 9.—For Additions, Machinery, and Engineering Works at Public Baths. Messrs. G. Elkington & Son, Architects, 95 Cannon Street, E.C.

**BEXHILL.**—Jan. 15.—For Enlarging and Part Rebuilding Church of St. Mark. Messrs. Riches & Esam, Architects, Station Road, Bexhill.

**BILLESDON.**—Jan. 2.—For Building Additional Vagrant Wards at the Workhouse. Mr. Bird, Surveyor, 16 Humberside Road, Leicester.

**BLAYDON-ON-TYNE.**—Jan. 8.—For Construction of Two Covered Service Reservoirs, &c., and Laying Cast-iron Pipes (12,800 yards), Supply of Cast-iron Pipes, Valves, Hydrants, &c. Mr. H. Laws, C.E., 18 Grainger Street West, Newcastle-on-Tyne.

**BRADFORD MOOR.**—Dec. 20.—For Building Four Houses. Mr. William Rycroft, Architect, 12 Bank Buildings, Manchester Road, Bradford.

**BURSLER.**—For Sewering and Forming Intended Streets, Longport Hall Grounds. Mr. A. R. Wood, Architect and Surveyor, Tunstall.

**BURY.**—Dec. 22.—For Supplying 500 lineal yards Salt Glazed Fireclay Invert Blocks. Mr. J. Cartwright, C.E., Borough Surveyor, Bank Street, Bury.

**BURY.**—Dec. 22.—For Supplying Iron Castings for Waterworks. Mr. Thomas Rigby, Waterworks Manager, Parson's Lane, Bury.

**BUSLINGTON.**—Dec. 24.—For Restoration of Work-shops and Sheds at Leather Works. Messrs. Wilson & Bailey, Architects, 35 Park Square, Leeds.

**CANTERBURY.**—Dec. 30.—For Building Cellars, Malt Store, &c., and Removal of existing Buildings, Dane John Brewery. Messrs. Stopes & Co., Architects, 24A South-wark Street, S.E.

**CARLISLE.**—For Building Home for Incurables. Mr. G. D. Oliver, Architect, Carlisle.

**CHATHAM.**—Dec. 24.—For Construction of Iron Pier on Site of existing Sun Pier on the Medway. Messrs. Law & Chatterton, C.E., 46 Queen's Anne's Gate, Westminster.

**COCKERMOUTH.**—Dec. 25.—For Converting Schools into Chapel. Mr. R. S. Marsh, Surveyor, Cockermouth.

**CROSS HILLS.**—Dec. 22.—For Building Six Houses at Sutton Mill, and Construction of Sewer. Mr. S. Jackson, Architect, 33 Kirkgate, Bradford.

**CROSS HILLS.**—Jan. 5.—For Extension of Hayfield Mills Premises, Glusburn. Messrs. Petty & Ives, Architects, Waterhouse Street, Halifax.

**CUCKFIELD.**—Dec. 23.—For Additions to National School Buildings. Mr. F. W. Holloway, Architect, Hayward's Heath.

**DELPH.**—Dec. 20.—For Building Wesleyan Infant School. Mr. Alexander Banks, Architect, 231 Rochdale Road, Oldham.

**DENHOLME.**—Dec. 22.—For Extensions to White Shaw, Messrs. Milne & France, Architects, 99 Swan Arcade, Bradford.

**DONCASTER.**—Dec. 22.—For Building Church or Church school at the Holmes. The Secretary, Holmes Church Committee, Mansion House, Darlington.

**DUNDEE.**—Dec. 20.—For 4,000 yards of Whinstone Kerb, 6 inches thick, and 4,000 yards of Whinstone Channel, 9 inches broad. Mr. Wm. Mackison, Burgh Engineer, 79 Commercial Street, Dundee.

**DUNFERMLINE.**—Dec. 22.—For the Mason, Joiner, Plumber and Gasfitter, Slater and Plaster Works of Additions and Alterations at the Carnegie Works. Messrs. Campbell Douglas & Sellars, Architects, Glasgow.

**DYONSDALE.**—Dec. 26.—For Building Board Schools, Mr. W. Yates, Clerk to the School Board, Distington.

**EDINBURGH.**—Dec. 23.—For Construction of Public Wash-houses and Baths. The Superintendent of Public Works, 11 Royal Exchange, Edinburgh.

**ESON.**—Dec. 31.—For Building Cottage at Cemetery. Mr. R. Moore, Architect, 7 Albert Road, Middlesbrough.

**EXETER.**—Jan. 6.—For Alterations and Additions to Homesteads on Barton Farm, Broadclyst, and Upton

Farm, Clyst Saint Lawrence. Mr. C. E. Ware, Gandy Street Chambers, Exeter.

**FARNHAM.**—Jan. 1.—For Rebuilding Plough Inn. Mr. S. Stapley, Architect, West Street, Farnham.

**FRODSHAM.**—Dec. 22.—For Sewering District of New-town. Mr. H. Bancroft, C.E., 83 Mosley Street, Manchester.

**GLASGOW.**—Dec. 22.—For Forming Main Sewer in Grounds of Belvidere Hospital. Mr. John Carrick, Master of Works, City Chambers, 74 Hutcheson Street, Glasgow.

**GLEADLESS.**—Dec. 20.—For Building Villa. Mr. John Clark, Architect, 38 Norfolk Street, Sheffield.

**GOOLE.**—Dec. 22.—For Excavation, Filling, and other Works in Formation of Goods Yard. The Engineer, Hunt's Bank, Manchester.

**GUIDE BRIDGE.**—Jan. 9.—For Constructing Footbridge and Subway at Railway Station. The Engineer, 28 London Road, Manchester.

**HOLNWOOD.**—Dec. 23.—For Building Retort-house. Shed, and Chimney. Mr. H. Andrew, Gas and Water Offices, Oldham.

**HUDDERSFIELD.**—Dec. 30.—For Building House, Boundary Walls, and Out Offices. Messrs. John Kirk & Sons, Architects, Huddersfield.

**HUNCOAT.**—Dec. 22.—For Building Waiting-room, Booking-office, &c., at Station. The Engineer, Hunt's Bank, Manchester.

**IPSWICH.**—For Additions to Business Premises. Mr. E. F. Bishopp, Architect, 32 Museum Street, Ipswich.

**KENDAL.**—Dec. 30.—For Building Tower, Crosthwaite Church. Mr. J. Bintley, Architect, 7 Lowther Street, Kendal.

**MAIDSTONE.**—Dec. 27.—For Laying Sewer, College Walk. Mr. E. Hoar, Local Board Office, Maidstone.

**MIDLAND RAILWAY.**—Dec. 22.—For Building Boiler-house and Chimney Shaft, Derby. Mr. A. Langley, Engineer, Midland Railway, Derby.

**NEWCASTLE-ON-TYNE.**—Dec. 22.—For Building Printing Works, Fenkle Street. Mr. J. W. Taylor, Architect, 33 Westgate Road, Newcastle-on-Tyne.

**NORTH SHIELDS.**—Dec. 20.—For Building Keeper's Lodge and Stable for Cricket Club. Mr. H. Gibson, Architect, 101 Howard Street, North Shields.

**PEEL.**—Dec. 23.—For Taking Down Wooden Drill Shed, Battery, Magazine, and Latrines at Barrow-in-Furness. Removing and Re-erecting at Peel. Director of Works-Department, Admiralty, 71 Spring Gardens.

**PENDLETON.**—Jan. 12.—For Construction of Railway from Pendleton to Hindley (13 miles 9 chains); Connecting Line at Agercroft (38 chains); and Connecting Line at Westthroughton (1 mile 30 chains). The Engineer, Hunt's Bank, Manchester.

**PLYMOUTH.**—Jan. 5.—For Building Cattedown Road Schools, Caretaker's Residence, &c. Mr. H. J. Snell, Architect, Courtenay Street, Plymouth.

**PONTYPRIDD.**—Dec. 24.—For Additions to Cilfynydd Inn. Mr. John Williams, Architect, 3 Edward Street, Morgantown, Merthyr.

**PRIMROSE & CO**  
CHURCH ST.  
SHEFFIELD.

**ECLIPSE** PATENT  
ROOF GLAZING

NO PUTTY, PAINT,  
ZINC OR OTHER  
PERISHABLE MATERIAL.

IN EXTENSIVE USE FOR RAILWAY STATIONS, MILLS, &c.  
NO OTHER GLAZING CAN BE WARRANTED INDESTRUCTIBLE.

PRIZE MEDAL AWARDS: KENSINGTON, MANCHESTER, LIVERPOOL, DONCASTER 1882-3.  
THE ONLY GLAZING AWARD. INTERNATIONAL HEALTH EXHIBITION, 1884.

**POINT-OF-THE-INCHES.**—Dec. 24.—For Erection of Buildings for the North of Scotland Navigation Company. Messrs. Jenkins & Marr, Architects, 16 Bridge Street, Aberdeen.

**PWILLHILL.**—Jan. 1.—For Building Parish Church. Rev. D. Jones, Vicar, Pwllheli.

**RAINFORD.**—Dec. 22.—For Building Cottages. The Engineer, Hunt's Bank, Manchester.

**RUNCORN.**—Jan. 6.—For Building Board Schools, Greenway Road, in Two Departments (207 Girls and mixed, 274 Children). Messrs. F. & G. Holme, Architects, 8 Westminster Chambers, Dale Street, Liverpool.

**SHEFFIELD.**—Dec. 24.—For Building Goods Offices. The Resident Engineer, Victoria Station, Sheffield.

**SOUTH SHIELDS.**—Dec. 20.—For Building Hall in Alice Street. Mr. J. H. Morton, Architect, South Shields.

**STOUGHTON.**—Dec. 30.—For Building Board School. Mr. S. Welman, Architect, High Street, Guildford.

**SWANSEA.**—Dec. 29.—For Additions to Danygraig School. Mr. E. Sidney Hartland, 5 Rutland Street, Swansea.

**SWANSEA.**—Dec. 31.—For Construction of Stoneware Pipe Sewers (3,000 yards) and Cast-iron Pipes (750 yards) for Sewerage of Port Tennant. Mr. R. H. Wyrill, Borough Engineer, Guildhall, Swansea.

**TARBERT.**—For Providing and Laying Fireclay and Cast-iron Pipes for Water Supply from Loch Chaorunn, and Extension of existing Mains; also Constructing Filters and other Works, Providing and Laying Fireclay Pipes for Main and Branch Sewers, Cast-iron Pipes for Outfall, Constructing Manways, and other Works. Messrs. Niven & Haddin, C.E., 131 West Regent Street, Glasgow.

**TOTTENHAM.**—Dec. 23.—For Construction of Brick Sewer, &c. Mr. de Pape, Engineer, Local Board Offices, High Street, Tottenham.

**YORK.**—Dec. 22.—For the Construction of Flood Banks, Subsiding Reservoir, Filter Beds, &c., at Pumping Station, near Accomb Landing. Mr. C. Hornsey, Engineer, 16 Railway Street, York.

## TENDERS.

### CARDIFF.

For the Construction of Sewers on the Penllyn Castle Estate, at Canton, Cardiff, for Mr. J. G. Richards Homfray. Mr. T. Waring, C.E., 12 St. John's Square, Cardiff.

Green	£768 5 8
Day	677 13 10
Allan	605 14 3
Franklin	589 5 0
Munday & Shepherd	577 6 5
Rees, jun., Ely, Cardiff	554 8 11
PEARSON (accepted)	508 10 4

All of Cardiff.

### CHESTER.

For Building Museum, with Schools of Science and Art, Chester. Mr. THOMAS M. LOCKWOOD, Architect, 80 Foregate Street, Chester. Quantities supplied.

#### For Terra-cotta Dressings.

Forrester & Mayers, Chester	£9,350 0 0

Exhibition, 1884.

**GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.**

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

TESTIMONIALS.  
"9 Victoria Chambers, Westminster, S.W.  
"June 10, 1884.  
"SIR,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it. "Yours, &c.  
"JAMES WEIR, F.R.I.B.A.  
"To Mr. Grundy."  
"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square.  
"February 15, 1884.  
"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."  
From James Garry, Esq., Architect, West Hartlepool,  
July 1884.  
"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools in  
course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public.  
"Mr. John Grundy."

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

**BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION** for coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent. more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh, and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use.

A horizontal boiler, 17 ft. 6 in. long, 15 H.P., gave the following results:—

Temperature on Plates ..	..	..	..	..	188 deg.
„ „ „ „ „ „	„	„	„	„	94 „

One ton of coal was saved per week, and, although the fire was raked out every evening 20 lbs. of steam were in the boiler next morning.

The following testimonial refers to this covering:—

Dear Sir,—It may interest you to know that we save exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

**BELL'S ASBESTOS PAINT**, for floors, stairs, and all interior woodwork, to prevent the spread of fire. This paint is especially useful in cotton mills, and in fact in all factories and buildings exposed to risk from fire. It is quite free from poisonous ingredients, and is both easily and cheaply applied. Bell's Asbestos Paint has, on several occasions, done great service in preventing the loss of life and property. The great fire in Buchanan Street, Glasgow, in November last, produced the following testimony to the value of this material:—

Offices of the *Glasgow Herald*, the *Weekly Herald*, and the *Evening Times*.

Mr. John Bell,  
Sir,—As one of the means that helped to save our buildings extending from Buchanan Street to Mitchell Street from the recent great fire, I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the *Evening Times* case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of the Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces. With the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood, thrice coated with Irish Lime, at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

**BELL'S ASBESTOS SASH-LINE CORD** is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire escapes.

## BELL'S ASBESTOS.

The goods of this house are of the highest quality only, and no attempt is made to compete with other Manufacturers by the supply of inferior materials at low prices. All orders must be sent direct to the undermentioned depôts, and not through agents or factors.

**BELL'S ASBESTOS AND INDIA-RUBBER WOVEN TAPE AND SHEETING** for making every class of steam and water joint. It can be bent by hand to the form required, without puckering, and is especially useful in making joints of manhole and mudhole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 feet, from 1-in. to 3-in. wide, and any thickness from  $\frac{1}{16}$  in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears the trade mark, without which none is genuine. It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at my price, users are recommended to see that every 10-ft. length of the Asbestos Tape purchased by them bears the trade mark.

**BELL'S ASBESTOS CEMENT** for the backing of firebricks and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firebricks and kitchen ranges of private houses. Any labourer accustomed to handle other cements can apply this.

**BELL'S ASBESTOS BOILER PRESERVATIVE.**—This useful mixture, by absorbing the free oxygen that is in the water, entirely checks pitting and corrosion. It also disintegrates incrustation so immediately as to prevent its adhering to the plates. Not only is a great economy of fuel effected by keeping boilers clean, but the risk of having the plates burned is thereby obviated. It has been computed that 1-16th inch thick of incrustation causes a waste of 15 per cent. of coal;  $\frac{1}{8}$  inch thick, 60 per cent.; and  $\frac{1}{4}$  inch, 150 per cent. Thus the Preservative avoids the great risks which are inseparable from scaled plates, lengthens the life of a boiler, and covers its own cost a hundredfold by economy of fuel. It is entirely harmless, and has no injurious action on metals. It can be put into the feed tank or boiler, as may be most convenient. Sold in drums and casks bearing the trade mark, without which none is genuine.

**BELL'S PURE ASBESTOS CLOTH**, for protection against the spread of fire. Iron curtains warp, and in the great emergency of fire will often be immovable. Asbestos cloth, being incorruptible, will remain strong and flexible for an indefinite period, and will stay the progress of a fire and the passage of smoke longer than any other known material. This cloth is also extensively used in Maignen's unequalled water filters, for which a gold medal and diploma of honour were awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

**BELL'S ASBESTOS BLOCK GAS FIRES.**—The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas burner, is fixed at the bottom of the block. After being lighted a short time, both the block and asbestos fuel throw out intense heat.

**BELL'S ASBESTOS FUEL** for gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

**BELL'S SPECIAL LONDON-MADE ASBESTOS MILLBOARD**, for dry steam joints, made of the best Asbestos fibre, is well-known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and  $\frac{1}{2}$  millimetre to 25 millimetres thick. Each sheet bears the Trade Mark.

# The Architect.

## AN ARCHITECTS' CONVENTION IN AMERICA.

THE position of American architects cannot fail for many reasons to excite interest among their English brethren, and we are confident that our readers will be glad to hear something about the foundation of the new Architectural Society in Chicago. That city is by itself a memorial of the enterprise and pluck which characterise the United States. The fire which consumed Chicago little more than a dozen years ago was enough to overwhelm a state for a generation at least. But no time was lost, and a new Chicago has

arisen, with buildings that would do credit to any city in Europe. It is also satisfactory to know that the fine streets are not made up of those speculative structures which have to change hands a great many times before they can be said to have owners. The city has a great and genuine trade, extending to nearly all parts of the globe, and while it flourishes there is a better prospect for architects and builders than can be found in the most brilliant feats of the Stock Exchange. Humble as they are, it can be truly said that tinned meat-cans form a firmer foundation for architecture than Wall Street prospectuses.

It is not surprising that many architects are attracted to the Illinois capital, which during the half-century of its existence has grown faster than any city ancient or modern. In the list of members of the new society there are nearly one hundred who reside in Chicago. Among them we find names which recall England, Ireland, and Scotland, with a great many which are clearly of German origin. There are some—such as RANDOLPH, CLEVELAND, CARROLL, LEE, and CLAY—which, on historic grounds, have a claim to be considered American.

The Convention of Architects commenced on the 12th of November last, and it was held in a building which is used for exhibiting building appliances. The hall was lent by the owner, Mr. H. L. GAY. A meeting of the kind does not take place every day, and it is not surprising that there was some little difficulty in arranging the procedure. In the first place a temporary chairman was appointed, Mr. BURNHAM, of Chicago, being selected. Then, in order to insure that non-professional persons should take no part in the proceedings, a committee was appointed to examine the credentials of all who were present. Afterwards Mr. BURNHAM delivered the thoughtful address which will be found in another column. The next part of the business was the election of permanent officers. It was considered that the selection should be entrusted to a committee of five members. After consultation, Mr. BURNHAM was selected as president and Mr. TAYLOR as secretary by the committee. But here a difficulty arose. Mr. BURNHAM declared that, from his want of acquaintance with the duties of a chairman, he did not consider himself to be eligible for the office. Several names were accordingly proposed, and while some said the president ought to belong to Chicago, there were others in favour of an outsider. Eventually Mr. BURNHAM was induced to accept the office. With the appointment of a committee to prepare a draught of a constitution and by-laws for the society, the first day's proceedings came to a close.

On the second day, after some formal business, the meeting settled down to the important work of constitution making. In the first place, the name of the society had to be determined. "The Western Association of Architects" was proposed by the committee. One member suggested that the words "of the United States of America" should be added, but the alteration was declined. Another member considered that "Central" should be substituted for "Western," but, after a discussion of the geographical points which were involved, the original title was adopted. The declaration that "the objects of the association are to unite in fellowship the architects of the United States, to combine their efforts so as to promote the artistic, scientific, and practical efficiency of the profession, and to cultivate and encourage the study of the kindred arts," was at once accepted. It was also decided that the association is to

consist of fellows and honorary associates; and that any architect practising in the States may become a fellow.

It is well known that in America there are a great many local societies, and practically the business of the Western and similar associations consists in the holding of annual congresses. The annual meetings of the new body are to be held on the third Wednesday in November, in such places as shall be determined at the previous meeting. It may seem strange to hear of the founders of an architects' society making a by-law that the meetings should be conducted in accordance with CUSHING'S "Manual." But, where disputes are likely to arise, it is prudent to have a fixed standard. At Chicago ROBERTS'S "Rules of Order" was adopted, on the ground that it was a manual better fitted for small meetings. The settlement of fees gave little difficulty. An entrance fee of five dollars is to be paid by those who are not members of State associations or of the American Institute of Architects. The annual subscription is to be two dollars. No objection can be raised against the association on account of its costliness to members.

Architectural practice was considered on the third day of the convention. A committee had prepared a series of resolutions to the effect that in his relations to clients and contractors the architect should be an impartial arbitrator, and that under no circumstances should he act as a special-pleader for either party; that the relations between architects and clients should be confidential, and that no architect is worthy of employment who is unworthy of trust; that it was the sense of the association that the architect should in all cases superintend the work designed by him; that in cases where for special reasons the architect does not superintend the work designed by him, his responsibility ceases with the delivery and acceptance of the plans, unless by expert testimony it can be proved that the plans were defective; that the president, secretary, and treasurer of the association constitute a board of arbitration, whose duty it shall be to adjust all questions in dispute between members of the association and their clients, which should be submitted to the board. In regard to fees, it was proposed to follow the scale adopted by the American Institute of Architects.

It was inevitable that the subject of competitions should give rise to a good deal of discussion. The words of the resolution were "that no architect should enter a competition for any building or other work unless the decision of the competition shall be made by recognised experts." The first question that was asked was whether the resolution was to be binding on the members. It was said in reply that the committee who had framed the resolutions were of opinion that no resolutions or code of professional practice could, under all circumstances, be adhered to; what was proposed was simply an expression of the sense of the association which might be a guide to the members. In the course of the discussion a little was revealed about the conduct of people who institute competitions. From what the president stated it is plain that plans which are said to be unsuccessful are used by boards and committees without any compensation to the designers. Mr. BURNHAM said that in nine cases out of ten it is the custom to obtain plans from a number of architects and to manufacture a design from them without acknowledgment. All he wanted was that there should be an agreement in writing that every set of plans was to be returned without abstraction of any of the details. Yet, strange to say, the meeting was not prepared to go so far. It was said that the appointment of experts would remove the evil, but evidently many cases occur in which an expert is an impossibility. There are competitions for dwelling-houses and stores, where the building-owners believe they are competent to decide for themselves. One member rightly said that the association should insist on some kind of remuneration, if it were only that office expenses should be paid to every one who was invited to take part in a competition. When it is found that the plans first sent in are shown to the later competitors, one of the authorities saying, "We do not like this plan because of this feature, nor that because of that feature; if you can get out something better, go ahead," the first senders ought at least to have payment made to them. But as another architect said frankly, the authority or client is not altogether to blame in such cases. "We are too anxious to grasp," said Mr. CLAY, "to take and incorporate the ideas of others, and if every architect would refuse when he was making a working drawing to incorporate any idea of another,

he would very soon stop this sort of thing." After much discussion it was proposed to alter the resolution to the following:—"That no architect should enter into a competition for any building or other work unless the decision of the competition shall be made by recognised experts, who shall be appointed before competitive drawings are prepared, and who shall be accepted by competing architects." A long debate arose on the additions. One speaker said that if the experts are appointed before the architects compete, a man can decline to go into the competition should he not approve of them. Another said the resolution was an impossibility. A third objected to the phrase "recognised experts," as he believed it was absurd to expect a committee to decide on the experts before the competition had been advertised. On the other hand, there were speakers who maintained that the competitors should be satisfied on all points before they prepared their designs. Finally the matter was left to the consideration of a special committee.

Among other business it was afterwards decided that the place of meeting in 1885 was to be St. Louis, with Mr. ILLSLEY for chairman, Mr. GAY for secretary, and Mr. ADLER for treasurer. A banquet was not the least important part of the convention, for, as one of the speakers said, architects are strangers to one another, except when thrown together in the way of business, and those occasions are not always conducive to friendliness and fellowship.

About the time when the Royal Institute of British Architects was in course of formation in London, settlers were arranging with the red Pottawatomies for the land on which Chicago stands. It would be strange if there was not some difference between the first meetings of the English and the American Societies. The meeting at 43 King Street, Covent Garden, was presided over by a nobleman, who confessed that he was incompetent to fill the office, for he knew nothing of architecture as a science; and in deference to his lordship a sort of *dilettante* air was spread over the business of the first and many subsequent meetings. It would be indecorous to bring sordid subjects like those arising out of professional practice before so esteemed a nobleman. The Chicago architects are not, fortunately for themselves, troubled with impediments of that kind. They see no necessity for separating architecture from architects, and the first place in the programme is given to subjects which are essential to the existence of the profession. Is it not possible that of the two bodies, the Western Association has more shrewdness and a wiser recognition of fitness?

## SEMPER AND THE DEVELOPMENT THEORY.

By PROFESSOR G. BALDWIN BROWN.

THE attention which has been directed, through the pages of *The Architect*, to the late GOTTFRIED SEMPER, is a fitting tribute to a man of true genius. Few students of artistic history have read SEMPER "On Style" without feeling that its perusal made an epoch in their studies. Possessing a philosophic mind, he surveyed with a rapid glance the artistic development of the human race as a whole, and it fascinated him to trace the working of great principles through widely differing times and places. He may sometimes have driven his theories too far, as when he assumes a large use by the ancients of tubular construction in metal, though the only certain employment of it was, I believe, in the roof of the Pantheon at Rome. It is remarkable, however, what a vast collection of solid facts he got together from all regions and periods, and he seems to have possessed in addition a rare faculty of divination, which led him to anticipate some of the most recent results of archæological science. But the qualities which give SEMPER's book its value are just those that make it decidedly unsuitable for being boiled down into a Science and Art Department handbook. It is not sufficiently regular in plan for this purpose, and the parts which would naturally appear in an abstract are not those which give the book its distinctive character. Part of it is occupied with the laws of style in such matters as the decoration of walls, floors, and ceilings, and with discussions of the particular employment for industrial and decorative purposes to which different materials lend themselves. In these matters SEMPER makes little pretence of originality. He quotes largely from REDGRAVE, and continually laments his want of practical acquaintance with the specific qualities and technical handling of various

materials. Mr. STANNUS might be safely trusted to produce a more complete and useful treatise on the principles of decoration than that incorporated in SEMPER's "Style."

It is in the other portions of his work, where he takes a wider range, that we get at SEMPER's mind; and these portions, more philosophic and more subtle, would be likely to escape in the process of condensation. One great interest of SEMPER's treatment of his subject is its thorough accordance with the modern scientific method. He never rests in a fact of art history as it stands, as does his contemporary and rival theorist KARL BOETTICHER, but eagerly follows it backward to its origin. Development is to him the key to artistic history; and though he is as convinced as the author of the "*Tektonik der Hellenen*," himself of the supremacy of the Greeks in matters of style, he derives the forms they used from the arts of earlier peoples. This does not in any way tend to lessen the artistic achievement of the Greeks. It is now clearly seen that in no sphere, except perhaps the political, were they great originators. They were form-givers. Receiving art, religion, letters, science from the East, they fixed upon each alike a distinctively Hellenic stamp and made it entirely their own. The Doric temple, BOETTICHER and SEMPER would agree, is distinctively a Hellenic production; but while the former regards it as having sprung forth complete, "like ATHENE from the head of ZEUS," a stone building and a Greek building from the first, the latter, in a more scientific spirit, traces back its origin to wooden structures clothed with draperies and colouring, and associates it with the architecture of other ancient peoples.

In accordance with this view of development, SEMPER derives the monumental architecture of the ancients from festal structures of a temporary kind, and in so doing sets the art in a new light. Architecture no longer has a servile element; it no longer must be held to begin in structures for use or for protection, but in its position as a fine art it is from the first an art of expression, the outcome of religious or patriotic enthusiasm. "The festal apparatus," writes SEMPER, "the improvised framework or scaffolding, adorned and set out with all the accessories and the pomp which signify the character of the occasion and increase the glory of the festival, decked with rich hangings, entwined with boughs and flowers, with festoons and garlands, ornamented with fluttering streamers and trophies—this is the motive of the permanent monument, the object of which is to hand down to future generations the record of the solemn celebration and of the event which it commemorated."

SEMPER does not systematically develop his theory, but returns to it again and again throughout his work. On the strength of it he enforces the view, which is now the prevailing one, that the peripteral form of the Greek temple, as a monumental canopy over the shrine, is the original form of it, and that the old Vitruvian theory of the gradual enlargement of its plan from the temple in antis, the *prostylos*, &c., is untenable. On this conception of architecture, too, he bases his famous "*Bekleidungsprinzip*," or the principle of encrusting or clothing a common material with one more beautiful and costly, as, for example, stones with metal plates or with stucco and painting, wood with metal or terra-cotta, or brick with the marble slabs which have been in use in Italy from the close of the Roman Republic to the recent completion of the façade of Sta. Maria dei Fiori. It is a pity that he died too soon to learn that the Greeks sometimes carried this principle so far as to clothe with plates of terra-cotta the solid stone of their Doric cornices! The origin of all these processes he finds in the covering of the posts and boards of the festal structure with rich draperies and garlands.

A large part, however, of the interest of this theory of the derivation of monumental architecture resides in its bearing upon the philosophy of art in general. To many people it would seem to give art a new character; to be, in short, a paradox. As one of the speakers in the recent discussion at the Royal Institute of British Architects expressed it, it is somewhat of a shock to find that what had been looked upon as "real truth" is "real sham." We must, however, look a little deeper than the apparent paradox. Do we not need in this country to modify a little our current views as to "truth" in art? The influence of WORDSWORTH's poems and prose, and of later and still more eloquent utterances, has brought about a sort of association between "truth to nature" in art and moral uprightness and humility. It has come to be believed in some quarters that the mere close copying of

natural detail in pre-Raphaelite fashion is a moral service, reverence paid to the divinity of nature, and the like. The artist must deal with us truthfully, just as the tradesman must sell unadulterated goods, and architecture, which is not the same inside as out, is in a reprobate style. Through all these notions of his enemies the "Æsthetiker," the "Roman-tiker," and the "Symboliker," SEMPER, armed with his "principle of covering," hewed his way. It was nothing to him that a work of art answered to austere moral requirements. He felt no more rapture at seeing the whole structure of a Gothic building revealing itself to the eye, than if he had been shown a man who wore his ribs outside his waistcoat. This robust view of art, expressed in language of a rugged eloquence, is given in the following note on page 216 of the second edition of "Der Stil":—

I say that the processes of clothing and of masking are every whit as old as human civilisation, and delight in them is precisely the same thing as delight in all that makes men sculptors, painters, architects, poets, musicians, dramatists—or, in a word, artists. Every artistic effort on the one side, every artistic delight on the other, implies a certain spirit of revel; and, to use a modern expression, the smoke of the Carnival taper is the true atmosphere of art. The annulling of reality, of the *material*—this is essential wherever it is intended that the *form* shall stand forth as the pregnant symbol, the independent creation of the human spirit. We must make forgotten the means which have to be used for the production of the artistic impression, and not blurt them out where they are not needed, and miserably mistake our rôle. To this principle the natural man is led by his unsophisticated feeling in all early artistic attempts. To this again return the great, true masters of art in all her departments, only that these in the time of the highest development of art *mask even the material of their masks*. This it was that led Pheidias to his treatment of the two subjects in the tympana of the Parthenon. It is clear that he conceived of his theme—the double myth he had to represent and the divinities which appeared to play their parts in the story—as a material to be treated just like the stone out of which they were made. And this material he sought as much as possible to conceal; that is to say, he freed the divinities from every sort of material outward sign of their unrepresentable religious nature. In that way his gods come before us; they rouse our enthusiasm both singly and in their connection, before everything else, as expressions of the purely human Beautiful and Good. What's Hecuba to him?

For the same reasons, the drama can only have importance at the beginning and at the highest pitch of the developed civilisation of a people. The oldest vase pictures give us ideas of the early materially-masked plays of the Greeks. In a transfigured form, like that stone drama of Pheidias, do Æschylus, Sophocles, Euripides, and at the same time Aristophanes and the older comedians take up again the primeval masked play, and the proscenium becomes the framing of the picture of a mighty piece of the history of humanity, which has indeed never been acted in reality, but which is for ever recurring, and will recur so long as human hearts beat. What's Hecuba to him? The revel of the mask breathes through Shakespeare's dramas. Revel and smoke of taper, the spirit of the Carnival—and this is indeed not always joyous—meets us in Mozart's "Don Juan;" for music too needs this annullment of reality in form, and to the musician, too, Hecuba is nothing, or should be nothing.

But it boots little to wear a mask where behind the mask things are not right, or where the mask is useless. Before that the material (of which we cannot get rid) can be in the sense in which we are speaking *annulled in the artistic representation*, it is necessary first above all things that it should be completely mastered. Only perfect technical finish, well-understood and correct handling of the material according to its qualities, and, above all, a constant reference to these last in the process of giving the artistic form can make the material forgotten, can emancipate from it entirely the artistic representation, can in a word elevate a simple study of nature to the rank of a lofty work of art.

This is strong meat, and some who seek for inspiration where WORDSWORTH found it may not relish it. It is only, however, a strong expression of a truth, which, on consideration, all must recognise—that before art can be, nature must be recreated by human thought. Those to whom the "primrose by the river's brim" is more than a mere "yellow primrose" have made it what it is by their own thought. From this to the "Birds" of ARISTOPHANES or to "Faust," there is only a question of the *degree* to which the human imagination transforms nature. And is there really this antithesis between nature and human thought? SEMPER's paradox is made plain by a greater than SEMPER, one who, true to the bent of his genius, brings to light a profound philosophic truth through a conversation between an old man and a girl at a country

festival. PERDITA will not have "streaked gilly-flowers" in her garden because—

There is an art, which, in their piedness, shares  
With great creating nature.

And POLIXENES answers in words which contain in brief the whole theory of art—

Say there be;  
Yet nature is made better by no mean,  
But nature makes that mean: so, o'er that art,  
Which you say adds to nature, is an art  
That nature makes. You see, sweet maid, we marry  
A gentler scion to the wildest stock;  
And make conceive a bark of baser kind  
By bud of nobler race: this is an art  
Which does mend nature—change it rather: but  
The art itself is nature.

PERDITA yields to the argument, and answers, "So it is." POLIXENES presses his advantage:—Then make your garden rich in gilly-flowers. But here PERDITA turns the tables on the philosopher by enunciating a principle still more fundamental in art than his:—

I'll not put  
The dibble in earth to set one slip of them.

This delightful assertion of the freedom of individual taste is after all the only outcome of the wise artistic discussion. And as this will certainly prevail now as ever, notwithstanding all our convincing arguments, we may leave SEMPER and the Mediaevalists to fight their battles as long as they will.

## THE ARCHITECTURAL ASSOCIATION.

THE fifth ordinary meeting of the Association was held on Friday evening, the 19th inst., Mr. Cole A. Adams, president, in the chair.

The following gentlemen were elected members:—Messrs. C. A. Callon, F. W. Foster, A. Evans, Howard Joseland, C. Torry, W. Fenner, H. Helsdon, F. R. G. Wills, A. E. Tiller, C. G. Bousfield, W. Hoe, J. R. Rhind, and P. P. Carey.

Mr. Lawrence Harvey was elected a member by acclamation, on the proposition of the President.

Mr. W. H. AITKIN BERRY, hon. secretary, said that it had been thought desirable to print an extract from the report of Mr. George Aitchison, A.R.A., on the work submitted in competition for the prize in the Class of Colour Decoration, 1884, as it contained some valuable remarks. Some copies were still left, and members wishing to have a copy could apply to the Secretaries at the close of the meeting.

Mr. W. H. WHITE then read a paper, as follows:—

### The Antechamber, to-day and yesterday, in French and English Plans.

I believe it to be generally admitted by editors, publishers, and booksellers that a great many more papers would be written, published, and offered for sale than actually happens to be the case were the supply of subjects for dissertation more plentiful than it is. I am told that there are even gentlemen living—members of our profession—who have early in a session undertaken to read nameless papers before societies, like ours in the hope that a subject to write about may, as a matter of necessity, occur to them before the day of execution arrives. But in my case I determined upon a subject, and invented a title, before ascertaining whether there was much or indeed anything to write thereon. That title runs smoothly enough: "The Antechamber, to-day and yesterday, in French and English Plans;" and if you hold me to it, without mercy, my task will be soon accomplished, for an antechamber is merely the *amphithalamos* of Vitruvius's Grecian house, and in both the French and English distribution of a dwelling-house is that piece which is *ante* to a bed-chamber. Permit me therefore to play upon my title with just that license accorded to those earnest expounders of inspired sentences who admonish us twice on Sundays. Let me divide the text into three parts, and put my subject, Cerberus-like, under three heads, in which the ante-room shall be treated literally, colloquially, and then broadly and generally in the architectural sense of *vestibulum* and *abium*. But before plunging into space, I want a beginning—a something to connect the subject with current topics—and I am reminded that the country is at present in the full enjoyment of a centenary; that this day one hundred years ago, less a few hours, a great English lexicographer was buried in Westminster Abbey amidst the respect and gratitude of the nation; and so, as in writing a paper or a poem, there is "nothing so difficult as a beginning . . . unless perhaps the end," I will begin at once, and with another quotation.

"Seven years, my lord, have now passed since I waited in you

outward rooms, or was repulsed from your door." Surely not the very youngest member of this excellent Association ignores the incident which served to put those words into a letter addressed by Dr. Johnson to the fourth Earl of Chesterfield. The scene has been depicted by artists, has been mentally portrayed by thousands of James Boswell's readers, without, perhaps, a thought of the house in which the event happened. Indeed, it was only a few weeks ago that I asked myself whether the house at the end of Stanhope Street, Mayfair, was really that in which Dr. Johnson "did antechamber," or that I doubted whether the outward rooms of a peer in the days of George II. could be other than stately pieces. Have we not all seen pictures of a vast antechamber or vestibule crowded with aspirants more or less motley, with the gloomy doctor seated uneasily, leaning on a clumsy stick, and frowning at Lord Chesterfield's back, after he had passed with a troop of friends, and paid no heed to clients anxiously searching for a patron? But, gentlemen, on the wall is a plan of Chesterfield House, taken from the "*Vitruvius Britannicus*" (ed. 1767, vol. iv., plates 67, 68, 69), and there at the door you will see very little room for an assemblage such as I have described. A hall chair and table, two or three flunkies, and my lord's gracious presence, would have effectually blocked that entrance passage, which merely forms part of the principal staircase to the house itself. There is nothing in that Mayfair residence of an English nobleman which fulfils the idea of an antechamber such as Charles II. brought to Whitehall from France, such as, two hundred years ago, Italian and French architects made an important feature in their distribution of rooms, in a house or a palace, or such as, one hundred and thirty years ago, J. F. Blondel discoursed of in Paris, to the students of his school of arts, a short time before he became a professor of the Royal Academy of Architecture.

The antechamber is famous in history, and, perhaps more than any other part of a house, its existence has helped to make history. Mackintosh and Macaulay repeatedly use the term, which to Fielding and Addison was familiar, and Dr. Johnson has warned us that it should be spelt with an *e*, not an *i*, as the Dictionary of the French Academy still has it. Gibbon has much to tell of the Roman antechambers, and Cicero of the clients who waited in them. The ancient fashion of waiting in the early morning at a great man's door to attend his levee, or, in the vernacular, his getting-up, has survived even to the present day in Paris. In the age of Louis XIV. it formed a part of the stately manner, as it is possible to picture it from the stately phraseology of the time. If Pliny left home before sunrise to pay his respects to Vespasian, there were historians in the antechamber of Louis hours before the eyes of his most Christian Majesty were opened; and, during the Second Empire, a well-known Minister of Napoleon III. received people of business at half-past seven in the morning in his dressing-room, which served as an antechamber. Indeed, the custom of early visiting on matters of business is very general among Parisians, the mass of whom are at work an hour after daybreak. If you had business with Viollet-le-Duc it was necessary to call on him before nine a.m., and I have found his library full of different kinds of visitors at eight o'clock. In this country the levee,\* which, as a formal homage to the sovereign, is identical with classical precedents, takes place in the afternoon, and therefore, as far as the meaning of the word goes, is a misnomer. In the time of the Louis's there was the great and the petty "getting-up in the morning," and the pictures of such events extant are curiously interesting—for the bed-chamber of the last century and of the one previous to it rather resembled a modern drawing-room than a bedroom as we understand it now, and the antechamber which led into it was usually a luxuriously furnished apartment, preceded often by a smaller room called the first antechamber, in which the servants waited.

There is nothing supremely elevating in the subject of an antechamber, or of the conversation likely to have taken place there; but those who read French well enough to enjoy the splendid literature with which the architects of the Bourbon dynasty have endowed the noble profession to which it is your privilege, and mine, to belong, will agree with me in admiring the rounded sentences of François Blondel when he submitted himself to Louis the Great, and those of Desgodetz when he approached Colbert. Be sure that these men, whom you no doubt regard as old classic fogies, extinct like the dodo, did antechamber in the grand fashion, of which we in England have little idea. In this country the spirit of the Renaissance was never imbibed as it was by the French of the sixteenth century, and this was probably due to the disturbed condition of home politics at the time, though the national character may have contributed to render obeisance less facile to Englishmen than it was in France. Indeed, Horace was often less fulsome in his prostrations to Caesar and Mæcenæ than were some of the French philosophers and poets of the great age to princes and nobles. To do antechamber then was the pro-

vince of persons who aspired to live by literature or art, and it was only towards the close of the last century that emancipation from such unworthy thralldom was effected. It is pleasant to remember that, years before his death, Voltaire held the position of a patron rather than a client; and in England Prior was an ambassador, Addison a Secretary of State, while the most conspicuous figure in English politics in the reign of our dead but ever-gracious idol Queen Anne—I mean Lord Bolingbroke—was friend and jolly good fellow with the three Yahoos of Twickenham—Swift, Pope, and Gay.

It is pleasant, moreover, to read J. F. Blondel, and the architect, Patte, his editor, when they discourse on the antechamber, especially because both had a great deal to do with the development of home comforts in so far as they depend upon the arrangement of a dwelling-house. In their time the proper position of an antechamber was more important than the direction or turn of a corridor is in ours. J. F. Blondel, in his "*Cours*," complains of "our young architects," your *confrères*, gentlemen, who competed for the Prize of Rome, and took the first place among architects in most of the European capitals and great cities—those young architects who constantly forgot that a first antechamber was required in good houses to precede the antechamber which was often used as a dining-room—and thus got found out for being what it always was: a mere passage-way from one part of the building to another. The fact is that most châteaux, at the beginning of the Renaissance, were merely long narrow blocks of building divided crossways into rooms, one of which, selected here and there, was an antechamber. You had to pass, in going over such a building, from or through one room to another; and the antechamber, like the hall of ancient times, was an apartment common to every one, in which most of the servants spent the day and some the night. The doors of several rooms opened into it, and thus it was like the saloon of a ship—which is used as a breakfast, dining, and tea room—surrounded by rows of private cabins.

Herein was the defect that Patte and Blondel stigmatised, visible in all the plans of the last century, and not completely remedied even at the beginning of this. If you want to judge of this defect in its most exaggerated form—of the sort of confusion engendered by such planning—you have only to stay a night or so at an inn, say in the Pyrenees, or some part of the country distant from any of the great centres of French life. In such places you may by chance get a bed allotted to you in a spacious though irregular room, which you may find full of doors. Englishman-like, you will try and lock those doors, but it is a dangerous practice, for often every one of them leads into another apartment, and in your haste to be secure from intrusion you may lock up a priest or a bagman—even a widow or a maid—to your own regret, and, possibly, their indignation. The careful manner in which we nowadays plan houses, both for town and country, so as to allow communication between every part of the building without necessarily passing through any of the various rooms, is an advance upon the earlier practice; and, further, the very improvements which Voltaire commended, as having been made since the reign of Henry IV.—which Patte signalled as having being perfected in his own time—would be regarded now as fatal blots in an ordinary residence. The stride of this century in that, quite as much as in other more remarkable things, has been gigantic, and it would be affectation in any one who appreciates what he reads, and who does not lose his head in the contemplation of the picturesque, to doubt or deny our manifest progress in the arrangement of dwelling-houses. But in our successful efforts to improve, we have improved the antechamber from off the face of our world altogether. In place of it we get a narrow corridor, with here and there a lobby, and, content with such improvement which has economy in its favour, the uses and advantages of an antechamber have become obsolete—at least, in England. Yet it served a great purpose in the old châteaux of Europe, and may still be seen in many that have not undergone alteration. To quote from a paper of my own, written a few years ago, an enormous antechamber often formed the sole entrance to a set of private apartments; it was a lofty room with a fireplace and large windows. The door to my lord's rooms was on one side, the door to those of my lady was on another. The bedrooms were used as living-rooms on ordinary occasions; only on extraordinary occasions were the great reception-rooms and the great dining-rooms used. In the descriptions extant of Versailles and Whitehall it is the antechamber in which courtiers met, and of which the most frequent mention is made; and I cannot refrain from urging those who are planning the now fashionable houses-in-flats to study some of these old French buildings, for there is a great deal in them which may be advantageously applied to the horizontal principle of house distribution, both as regards practical requirement and as regards artistic effect.

Take, for instance, a famous plan of a private house, designed and erected by J. F. Blondel, and published in his "*Cours*" for the purpose of showing students how to plan profitably upon a narrow and irregular site. Here is to be seen the antechamber as it was understood at the beginning of the last century, and the care with which he has managed to give an architectural shape to the room, in spite of more than one acute angle, is worthy of

\* Macaulay, writing of the "State of England in 1685," says:—"Hardly any gentleman had any difficulty in making his way to the royal presence. The levee was exactly what the word imports. Some men of quality came every morning to stand round their master, to chat with him while his wig was combed and his cravat tied, and to accompany him in his early walk through the park."

notice. Here, again, is a cheap block of flats built some years ago in Paris as a speculation, intended to pay its proprietor a good annual income. The block contains shops at the street level, and five residences on each storey, reached by three staircases; they are arranged for very ordinary people belonging to the middle class, and who are content to live, so to speak, on the Surrey side of the river, at a considerable distance from the Place de la Concorde. Every attention has been given to make the private entrance to each flat useful and agreeable. An entrance like that shown on the plan bears the name of "antichambre," and I venture to think that such a well-considered arrangement as the plan before you, the work of M. Bonenfant, for a mere middle-class block of residences of comparatively low rentals, forms a pleasing contrast to the higgledy-piggledy jumble of shapeless rooms which is now known to Londoners, and joyfully accepted by them, as an orthodox flat. I need not stop to reflect upon the kind of bonfire many of these London blocks would make were it kindled in the basement; for that is rather an affair for statesmen and speculators to treat of, after a catastrophe: my purpose is to point to the uncomfortable and inartistic character of these new-fashioned residences, no portion of which is uglier or more carelessly treated than the hall or antechamber. I live in a flat myself, and appeal to our young architects, with some degree of personal feeling, against the kind of thing to which I have to submit. My door opening inwards is 3 feet wide. Observe that the person opening the door from the inside must take refuge behind it, while the visitor entering from the outside strikes his nose against the wall in front of him. Flats with entrances like this, and containing seven, nine, and even eleven rooms, are letting easily for 120%, 140%, and 160% per annum, in neighbourhoods distant half an hour's walk from Piccadilly Circus.

Perhaps I may be allowed to refer to the fact of my having, in 1875, described to this Association "How the Parisians build a House in Flats." The paper was a fancy picture sketched at different times and from several examples: I made a further communication in 1878 to the Institute on "Middle-class Houses in Paris and London," and had I dared to say then that houses such as I portrayed—not altogether similar to those erected twenty years ago in Victoria Street—were almost immediately to cover whole streets in London and New York, the statement would have been regarded as the dream of an enthusiast. But the thing has happened, and I have a sequel to add which may be called a further dream. I want to see flat residences planned for central London, with three antechambers in each. An article written by me in 1878 contains twenty-four rules for planning and erecting such buildings. In the eighteenth rule it is laid down that "each residence be subdivided into three parts: one for day habitation, one for night habitation, and the third for the service." To those rules which I then formulated I would now go further, and add that "each subdivision have an antechamber proper to it." Thus the antechamber to the day division would be the entrance-hall, and perhaps during the dinner-hour the serving-room; the antechamber to the bedroom division might contain a linen-press, a female servant might sit there at work, and it would be common to the womankind of the household; the antechamber to the service division might be the servants' hall, and form a salubrious break between kitchen, scullery, &c., and the other portions of the residence. Of course I am not thinking of blocks of building like the French example I have shown, for so elaborate a scheme of distribution as that combining three antechambers; but I am convinced that if young architects who are working out the plans of flat residences will banish from their minds the modern idea of a passage, and try to realise the idea of two centuries ago—namely, that of the antechamber—they will attain to a principle of distribution more in harmony with the character of the problem to be solved than has yet been adopted by even experts in our art. By such a subdivision as that I have advocated, families may be properly accommodated in horizontal houses; but if the present mode of arranging these monuments of successful speculation be permitted to develop, the fashionable house-in-flats may become as fruitful a hotbed of disease, consequent upon overcrowding and want of air, as the worst slums of Marylebone or Soho.

Now, having treated the subject of the antechamber in a literal and in a colloquial sense, I will proceed, with your permission, to take an extended view of it, for we are now in the third and last phase of illumination as regards the text of this discourse.

Come back, then, for an instant to a state of primitive existence, and I feel sure that my friend Mr. Lawrence Harvey will afterwards assist me in unravelling the by-no-means tangled web of evolution. Horace sang of a simple enclosure containing a hearth or fire, around which lay the inmates—men, women, children, and slaves—while the smoke ascended through an issue in a roof of turf. That was the atrium, indeed the dwelling-house of Romans in the good old times, and it had a door but no windows. The client who waited upon his patron waited outside the door, and probably squatted there as natives of India do now in the verandah or the compound (campagna). But as the community developed, the atrium increased in size and character; the open area or vestibulum outside the atrium door got a roof put to it; and horse, cart, and chariot were protected from the weather. The hole in the

roof of the old atrium developed also, and as the *cavum adium* took architectural shape a receptacle was provided for the falling rain, which no longer served to damp the open hearth, but fell only to replenish a piece of water cunningly contrived in the midst of an antechamber common to all the members of a household, to the stranger within its gates, and to the slaves, though rarely entered by the Roman matron and her spinsters, who occupied a reserved part of the improved dwelling-house. All this becomes easy to realise when you have once visited a Pompeian house; and, depend upon it, the great mass of Grecian and Roman houses of the Augustan period were not very different from those that still exist, thanks to Vesuvius, on the Neapolitan shore.

In similar progression the Mediæval hall ultimately took the shape discovered by archaeologists. The hall of the twelfth century was a covered enclosure, strewn with rushes; dogs and horses, as well as men, women, and children, were sheltered within it. A fire was kindled in the centre for cooking purposes rather than for warmth; and if there be no absolute evidence of a hole having existed in the roof of such a hall, you may be sure that the lantern of a later period was only a logical refinement of it. Further, as manners improved, a part of the hall was reserved for the master and his family. Hence the dais or raised platform of wood, which afterwards got boarded in, and developed into the private chamber, the retreat of the lady of the household, the thalamos of Mediæval purity. Just as the vestibulum and peristylum developed in front and back of the primitive atrium, so chamber and antechamber grew naturally within the Mediæval aula or hall, and, to realise the process, you have only to live on shipboard for a short time. When you have watched, say in the Red Sea, a sailcloth rigged up across a portion of a vessel's deck, to shelter a group of ladies or some sick passenger, you can at once comprehend the slow method of development that culminated before the sixteenth century in the châteaux, palaces, and houses, with which our young architects of to-day are fatally familiar.

But to the people that read Dr. Perrault's translation of Vitruvius, to the great noblemen and great scholars who contributed to the magnificence of Louis XIV., the domestic works of the ancients were so many enchanted palaces, about which any extravagance would be believed possible, and to which any scale might be fearlessly applied. Perrault, with the mangled text of Vitruvius before him, designed a Roman dwelling-house of colossal dimensions, with area, vestibula, atria, cavaedia, forming the, so to speak, public part of the house, with peristylia and a host of rooms of every description forming the private portion. The Grecian house devised in the same fashion measures 350 feet in depth by 275 feet in frontage, that being, as you probably know, about 150 feet longer and 175 feet wider than the Parthenon measured at its topmost step. In the "Travels of the young Anarcharsis," written by the Abbé Barthelemy more than a hundred years afterwards, the plan of a Grecian house shows a thalamos measuring 32 feet by 25 feet, and an amphithalamos of similar shape and size, and the whole conception of the building is much more extensive than that of Perrault. Nearer our own time, Dézobry, who wrote a novel called "Rome in the age of Augustus," and Mazois, who wrote another novel in which he described the Palace of Scarus, imagined colossal edifices covering vast spaces sufficient to contain a Paris place or a London square. No wonder, then, that if scholars and experts lost their heads and continued losing them until nearly the middle of the present century, the princes and seigneurs of the Great Age took an exalted view of the images which the spirit of the time had set up, and accepted every estimate of classical magnificence provided only that it was big enough. Hence the Château de Richelieu rose like a small town, and all over France the great landowners reared quadrangles of constructions, with outer and inner courtyards and annexes; erected chapels, sometimes theatres, and combined within their own walls all the refinements, and indeed all the civilisation, of their time. This went on in France all through the seventeenth century, but the fashion was not general in England until the eighteenth. On the wall is a rough plan of Blenheim Palace, which was designed by Sir John Vanbrugh, and erected at the beginning of the eighteenth century; but the drawing shows only the principal buildings. Half a mile off on every side the country was mapped out to lead up to the palace. Avenues of trees, lakes and waterfalls, parterres, terraces one above another, perrons and flights of steps, astonished and confounded the spectator from any one of the hundred windows of the palace fronts. To misinterpret Pope, it was the architect's ambition of that day—

Jones and Palladio to themselves restore,  
And be whate'er Vitruvius was before.

Of all the marvels produced either in France or England in the last century perhaps the most beautiful as far as plan goes was the Château de Marly, which was pulled down by order of the first French Republic. On the table is a monography of this great and almost last work of J. H. Mansard, in which you will find many beautiful points to observe, but also very much to avoid. The sole excuse for these extravagances lay in the assumption that the glories of Athens and Rome were being successfully emulated in the architectural monuments of the day. Pope, how-

ever, saw the absurd aspect of this kind of bombastic revival, and satirised it in his epistle to the Earl of Burlington, wherein Cannons, the estate of Lord Chandos, is alluded to as Timon's Villa :—

Greatness with Timon dwells in such a draught  
As brings all Brobdingnag before your thought.

Who but must laugh, the master when he sees,  
A puny insect, shivering at a breeze !

My lord advances with majestic mien,  
Smit with the mighty pleasure to be seen ;  
But soft—by regular approach—not yet—  
First through the length of yon hot terrace sweat ;  
And when up ten steep slopes you've dragged your thighs,  
Just at his study-door he'll bless your eyes.

Before this was written Swift had caricatured with equal force the fashion of the day in literature. As terraces, vestibules, and antechambers had to be traversed before reaching my lord's presence, so books had their dedications, introductions, and prefaces. In "The Tale of a Tub," Swift begins with the author's apology, followed by a postscript ; then comes a dedication to the Lord Somers, with a word from the bookseller to the reader, after which a dedication to Prince Posterity precedes the preface, while the matter of the book itself is almost lost in an introduction and a conclusion of considerable length. The satire was deserved, and the commencement of the end of the grand epoch was thus announced. How the minds of men were affected by the "grand" and the "stately" in an age of courtesy and compliment, how they were guided in their appreciation of the works which served as its models, and ignored the Mediæval architecture of Western Europe, may be seen in Addison's description of the different effect produced by the contemplation of an ancient and a Mediæval building. "Let anyone reflect," he wrote in the *Spectator* (No. 415), "on the disposition of mind he finds in himself at his first entrance into the Pantheon at Rome, and how his imagination is filled with something great and amazing, and at the same time consider how little, in proportion, he is affected with the inside of a Gothic cathedral, though it be five times larger than the other, which can arise from nothing else but the greatness of the manner in the one and the meanness in the other."

But we have changed all that, and more than one British student of architecture has asked himself, when outside the Pantheon, whether the precious time of a tourist in search of the picturesque might be profitably wasted by stepping inside. This same tourist, in his passage through French and Italian cities, may yet regard the great *portes cochères* of ordinary houses, the spacious courtyards of private residences, as so much space to be built upon, which his own more acute compatriots would long ago have converted into a solid mass of offices or dwellings. He may yet wonder why palaces of justice, Government and municipal offices, possess vast halls or *salles des pas perdus*, always open to the public, and often full of people, seeing that in his own more favoured country, the birth-place of popular liberty and of common sense, the home of practical men, there are none of such things ; and year after year it becomes more and more patent that such things can be dispensed with, and, indeed, are the mere vagaries of an exploded theory or the outcome of affectation, which is profitable solely to the architect, as the one person interested in making what he may call a fine building. But neither in France nor Belgium, neither in Germany nor in Italy, do governments think or act thus. There, no portions of a public work are more carefully considered, or more spacious, than the portions open to the people, and devoted to their use. How such works are understood in France, what the character of ideas which guide the architects who devise them is, may be seen in some of the selected designs for the Prize of Rome, photographs of which are hanging on the wall. There is actually a palace of justice among them, the architect of which has conceived not only the desirability of a magnificent vestibule, but also a public hall giving access, on each of its three sides, to a court of law. Nor are these designs the chimeras of irresponsible youth. Many of them, matured and perhaps reduced in dimensions, are afterwards worked into practical shape ; they form parts of monumental buildings, paid for by the nation, and worthy of it—the very antithesis of that British notion of compactness which may yet culminate in placing the hall-porter of our proposed new Government offices in a box on the street pavement, when it shall be seen, too late, that the spirit of false economy and speculative adventure which inspires the action of modern Ministers has added a fresh architectural calamity to the list of their irretrievable disasters.

Now, what have we got in the place of the "grand" method of our fathers ? In lieu of a courtyard we have a low doorway opening upon the public street ; in lieu of a vestibule, of an antechamber, we get a vaulted corridor, which, in more than one instance I can name, has an entrance-door at one extremity and a darkened window at the other. Let us, then, inquire how this change has come about?—how men's minds have been led to accept the present haphazard fashion of planning new buildings, and the utter absence of any wish or attempt to compose them ?

That the course of revival during the present century has been

largely affected by literature of the romantic sort it is unnecessary to do more than note. That it entered upon a new phase after the attacks of Pope, and the wits that he inspired, has been explained over and over again. The Gothic cathedral, the fortress converted into a signorial residence, the bishop's palace, the manse, the grange, or what not of Mediæval origin and descent, when they first attracted the archæologist, were made up of the work of different and successive epochs. A hall erected in one century had its window openings doubled in size in the next ; fifty years afterwards a clerestory may have been added. The low porch, or the low arches of a cloister erected in the thirteenth century may have been partly pulled down and rebuilt in the fourteenth century with more sharply-pointed arches, and filled in with tracery. What met men's eyes when they first began to see the beauty, and perhaps the grandeur in Gothic work to which Addison was blind, was a something eminently picturesque—a something that retained its beauty under grey skies, could do without sunshine, enjoyed a monopoly of gloom which served for shadow, and possessed, in its dilapidated, ivy-clad condition, all the charming properties of a sketch and few of the prosaic, necessary fittings or fixtures of the finished building. All over the country were to be found works of this kind ; in many notable instances they were the heritage of noble families, of squires, and county people, whose reigning head might have pleaded, though he rarely did so, that the dilapidations of his ancestral home were typical of long descent and early connection with the soil. Then inquiry bred inquiry, archæologists mustered, architects learned to reproduce such houses. Rich men who were not proud of their ancestors, and even had reasons for not alluding to them, jumped to find that money could purchase and architects could provide country seats as varied in age and as old in appearance as any ancestral home in the island. If the plan was irregular, if portions of the new erection had a tumble-down look, if the principal entrance was low and a little out of the centre, if it led to the back instead of the front part of the house, the illusion was all the more agreeable and complete. Architecture thus conferred gentility, and no complication of hall or passage was too irregular, no grouping of parts too illogical to subdue the owner's proud reflection that his new house was of the very oldest and most historical in style. So, after all, the immediate outcome of archæological science, whether it revive the ancient works of Athens and Rome or the Mediæval creations of Western Europe, is affectation, and not very dissimilar to-day from that of the great epoch of Louis XIV. and his successor. The Timon of Pope was pleased to create, often on a barren soil, something entirely new ; the Timon of to-day aspires equally to create, but in fertile glades, something supremely old ; and, as we are now considerate enough to deprecate with a smile the affectation of a Bathurst or a Boyle, so may posterity review kindly our present triumphs of architectural skill, which will, I fear, baffle, ere the next century be finished, all the wit of Birmingham, all the learning of Leeds.

Frankly, I feel that too much of the old grand manner—not to be confounded with the "grand old" manner—of the stately method of composition in architectural planning has been discarded, and that a too great regard for the picturesque at any price now tends to deprive a public building erected in this country of the oneness and harmonious disposition of parts which belong to the monumental erections of Paris, Vienna, and Berlin. I am not so Quixotic as to suppose that every building can be made to tell its proper tale, but I do most certainly think that our present method of grouping a congeries of buildings, with innumerable entrances, small and confined vestibules, all to do duty as parts of a public office, a town hall, or a palace of justice, is fatal to popular convenience and destructive of private comfort. In all such buildings there should be not only an entrance, well and conspicuously marked, but a central hall in which the stranger or the visitor may obtain information to guide him in his search for a particular office or a particular court. The architect can only by such an arrangement afford the means of making his building intelligible and facile to those who use it. But whether by the fault of others who pretend to instruct him, or from his own desire to be quaint and picturesque, many of the newest public buildings in this country fail in just those points—in the arrangement of those parts of a great building which should be common to the public—upon which the architects of the two last centuries lavished their skill, displaying therein a by-no-means contemptible acquaintance with ancient learning, which they used to the profit of the arts and manners of their time.

The PRESIDENT, alluding to the introductory remarks of Mr. White's paper, said that, looking at the paper simply in connection with anterooms, there was little to be said about the anteroom ; but that those who had followed Mr. White's meaning would have deduced from it that the Gothic revival had tended towards picturesqueness of effect rather than that balance and proportion of parts that distinguished the Classic period. In this respect the Classic school contained a useful lesson. In the present school of architecture, as exemplified by Mr. Norman Shaw and others, the tendency was towards making the hall the antechamber, and those who had studied the designs in the professional press would have noticed the hall as an important feature, as furnished, as serving as

a reception-room, having the other rooms grouped about it, and the staircase probably leading from it. There was no question that architects could design it, but too often the question of cost intervened, a question that staggered many an aspirant for fame. The President instanced the design of the Albert flats, where the visitor entered straight from the door into a square hall or reception-room, which gave access to the rooms of the flat.

Mr. LAWRENCE HARVEY said that a gentleman who had made much money by the practice of architecture had objected to the French definition of architecture, viz., *décoration construite*, and defined it instead as construction decorated. For the Frenchman architecture was to be art work for its own sake, while for the architect of Blenheim House it was to be the means of showing how great a man the owner was. If you took a picture out of its frame only a connoisseur would stop to examine it. Vanbrugh's idea was to give dignity to his client by surrounding him with masses of stone, and by letting it be seen that his client had in his mansion a chapel, grand kitchen, servants' hall, &c., and stabling. Good architecture consisted in giving a client everything that was necessary for him, and in giving a clear expression on the outside of the internal arrangements. In this respect he thought the Goth had a more correct idea of architecture than the Classicist. Vanbrugh, who was a playwright Mr. Harvey likened to M. Garnier, the architect of the Paris opera-house and professor of architecture. Both were fond of grand effects.

Mr. GOTCH proposed a vote of thanks to Mr. White for his paper. Mr. White had mentioned the introduction of the large plans from France in the last century. As matter of fact we had the large rambling style of plan already in the country. Audlem Hall, Cambridgeshire, was an instance of one of these immense structures. The hall now only occupied a quarter of the space originally covered. It originally consisted of a central block and two great courtyards, each of which were simply collections of rooms or lodgings, of no use, and only put up for effect. These were at last removed, so that at the time when the grand buildings Mr. White spoke of were being erected, Audlem Hall was being denuded, was tried and found wanting. The idea of making the hall a sort of sitting-room seemed admirable, and to be a piece of economy desirable to effect, because at present space was much wasted in halls and corridors.

Mr. BLAGROVE seconded the vote. In planning ordinary residences an architect, he said, did not get the opportunity of doing anything with the hall; it was only in large mansions he got scope for that. At Gatton Hall a fine effect was got by carrying the hall up two storeys at least, with glass at the top. As to Mr. Harvey's remarks about Blenheim House, some excuse might be pleaded for its faults because it was a distinctly monumental building, a sort of votive offering to Marlborough. Mr. Blagrove said he had read Vanbrugh's plays, and neither as playwright nor architect did he exhibit inferiority. The architect must not be blamed for the materials that were put at his disposal, and Vanbrugh had, he thought, made a very artistic use of the details in fashion in that day.

Mr. W. HILTON NASH said he felt rather hurt when Mr. Harvey spoke so disparagingly of Vanbrugh. Though he had his defects he had also his merits, and unlike the Italian palaces, built of lath and plaster, Vanbrugh built his palaces of good materials. The antechamber principle might certainly be utilised and made more of without sacrificing space.

Mr. CLARKSON, alluding to Chesterfield House, and the popular belief that Johnson had sat there, which had been controverted by Mr. White, said one hardly liked having to have old ideas ruthlessly knocked away.

Mr. FARROW thought great cost would result from the adoption of two or three antechambers, and that the price of flats would rise enormously. An examination of the illustrations of the German buildings in the Architectural Institute, Vienna, showed the liberality of the Government in granting large spaces of ground for erection of public buildings. The area of the courtyards were quite as large as the area covered by the building itself. When our Government could be got to allow ground on the same liberal scale, architects, he was sure, would give the country really grand buildings.

Mr. SLATER, Mr. STANNUS, and Mr. APPLETON having made some observations, the vote was put by the President, and carried by acclamation.

Mr. WHITE, in responding, said, as to the question of the adaptation of the French grand schemes of plan in this country, that Blenheim House was erected at the very beginning of the last century, and Castle Howard towards the close of the seventeenth century, so that this grand manner of plan came over from France in the latter part of the seventeenth century. Mr. Gotch had been quite right in alluding to the misinterpretation made. As regarded the lath and plaster of Italian palaces and the solid materials of Sir John Vanbrugh, and the epitaph of Sir John referred to by Mr. Nash, the words of Pope or Swift were, "Lie heavy on him, earth, for he laid many a heavy load on thee," but he did not think those words were written on Sir John's tomb. His justification in referring to Chesterfield House was that there was a view of it in Boswell's "Life of Johnson," and he thought there was no doubt that it was the house that Johnson was supposed to

attend. Mr. White pointed out where Johnson would have gone in. He could not have got in, as might be supposed, at the staircase, for there was no space there for the client to wait. As to the cost of three anterooms instead of half a one, his answer was that some owners were making 7 or 7½ on their outlay, others contented themselves with 4 or 3 per cent. Where people would be satisfied with a reasonable return for their outlay, there would be no difficulty in providing these rooms.

## HOLBEIN AND PORTRAIT PAINTING.\*

WHEN the change of feeling swept over Europe, which manifested itself in some countries as the Reformation, and brought with it a trail of peasant wars and political and social developments ramifying to every relation of man and man, the art of Europe everywhere reflected the new tendencies. The old social organisation gave way, and a spirit of independence and individuality went abroad. Guilds of all manner of local and industrial bonds fell to pieces, and the individual was left to fight for himself in the rough and ragged world. A new type of man arose, to whom self-reliance was a virtue of supreme importance. Everywhere, accordingly, the life-springs of ideal art began to dry up. Men no longer required pictures and images of saints and heavenly personages to remind them of the governance and sanctions of their life. They no longer looked far into the invisible world for hourly help, or, if they did, it was to an infinite impersonal impicturable power. It was upon himself in the main that each must rely; of himself he became more and more conscious; hence the age of religious art was succeeded by one of portraiture

### Portraiture.

Already Memling foreshadows the change by the attention he unconsciously devoted to the portrait of the kneeling donor, rather than to the Madonna of his worship; the next century, with its Holbeins, Tintorets, Cranachs, and Dürers, carried the revolution through. The individual in the fulness of his individuality was the sum and substance of all great sixteenth century art. The loan collection contains more than one noteworthy example of the sixteenth century work. The finest is the picture of Lady Guildford, painted by Holbein in the year 1527. Holbein was the son of an indigent though remarkable artist of Augsburg. He learnt the rudiments of his craft from his father, and then went off to the thriving town of Basle, there to make his way for himself. Prosperity came gradually to him, and a reasonable fame followed in its wake. He was brought in contact with eminent men, Erasmus amongst the rest, and so it came to pass that when evil days fell upon Basle, Holbein was able to go to England with warm letters of recommendation to the great Sir Thomas More. He settled down at the Court of Henry VIII., and remained in England most of the years from 1527 to his death of the pest in 1543. During that time he painted the grandest series of portraits that any man has ever as yet produced.

The impression prevailed till comparatively recently that portraiture is a lower branch of art than the painting of subject pictures, or historical pieces, as the critics of the last century used to call them. Now a portrait may be one of two things. It may be a dull and accurate repetition of the lines and modelling of a man's face and costume, such as a photograph can produce with certainty and precision. Or it may be a representation of the man at a chosen moment amongst chosen surroundings. It is only a portrait of this latter character that can be called a work of art, but such a portrait belongs to the very highest range of human productions, and the maker of it attains almost to the divine rank of a creator. There are in every human face two qualities visible to all-seeing eyes. There is first the almost permanent expression of character by which the features have been moulded to their lasting form, the bones shaped, the flesh spread over them, and the wrinkles slowly ploughed in, one by one. As the man advances in years this expression grows more and more pronounced, every fleeting smile and every burdening frown leave behind them a trace which repetition finally renders almost permanent. The first duty of the portrait painter is to master the secret of this look of character, and to set that down plainly and unhesitatingly. Equally important, however, are the fleeting expressions that traverse the face of every man, whose mind is not an absolute blank, marking even in sleep the vagrancies of an errant fancy. Every thought sends its ripple over the surface, even as a fish swimming deep disturbs the level of a placid pool. And for every face there is one kind of expression that most frequently returns, and that acts as the strongest moulding force upon it. The fire of the orator blazes within him when he speaks, and sinks to quiescence when he is silent. The author knits his brow when seated at his desk, and relaxes it in his arm-chair. The merchant is most himself in his office; the labourer following his team along the weary furrow. All manner of men, in fact, must be caught when their minds are fully awake and their intelligence is active. The photographer can never so find them.

\* From a lecture by Mr. W. M. Conway, in connection with the Brighton Loan Collection.

The artist alone, by continued watching, can discover and fasten in a memory, large by nature and cultivated by practice, the fleeting glances and nervous movements of the features and members which mark the peculiar action of an individual mind. Lastly, the portrait painter, having mastered the fixed look of character, and the fleeting accidents of expression most properly belonging to his sitter when all his finest qualities are aroused, must choose for him such harmonious surroundings as are best adapted to the man. One is essentially a man of the open air, a brother of the mountain, the forest, or the brook; another is a man of affairs, a denizen of council-chambers, a manager of men; another is a man of solitude, study, and meditation; another a man of business, and another of pleasure. The surroundings must suit the character, and must be in themselves graceful of form, harmonious in colour, and balanced in grouping of light and shade. Such is the problem of the portrait painter. He must be a perfect artist in all that pertains to his craft; he must have perfect insight, and an unflinching memory. Such a man more nearly than any that ever lived was Hans Holbein, the younger. A secondary, but still an important necessity for a great school of portraiture, is that a number of men should exist in a society worthy of being painted and capable of defraying the necessary expenses. There are great men in every age, but they are not always the men who employ artists. As often as not the great men are hidden, and only the lesser ones float like corks to the surface. In Holbein's day it was, fortunately, otherwise. The courtiers and state-men who served Henry VIII., if not the greatest with which England has been blessed, were yet men of extraordinary calibre. Some of them, such as Sir Thomas More, Holbein's especial patron, were made of the very finest English clay, and fashioned in the noblest mould of the genius of our race. Besides, there were Warhams and Fishers, Colets and Stanleys, Cromwells, and a host of other lights, whilst amongst foreigners such epoch-making men as Erasmus and Melancthon were enough of themselves to make any artist's fame.

#### *Holbein's Picture.*

And now let us turn to Holbein's picture itself, and see how far it exemplifies the qualities thus roughly indicated. It was painted in 1527, the year of Holbein's arrival in England with letters of introduction to Sir Thomas More. The first picture he made was no doubt the portrait of his patron, a work of surpassing excellence, not many years ago shown at one of the London winter exhibitions. In the same year he painted portraits of Archbishop Warham and Bishop Fisher, both of them friends of More, and leaders of the party opposed to Wolsey. To the same party belonged Sir Henry Guildford, Controller of the King's Household. He was a knight banneret, distinguished in war, and early in this very year he had been honoured with the Order of the Garter. His picture Holbein painted, and I have brought with me for your inspection a photograph of the original drawing made for it, and now in the valuable collection at Windsor. A pendant to this picture, painted at the same time, is the magnificent portrait of his wife, Lady Guildford, exhibited here at this time. The three qualities I have led you to look for in Holbein's work are the presentment of character, the seizure of expression, and the pictorial virtues of rich and harmonious colour, largeness of light and shade, rhythm of line and balance of composition. These qualities you will have no difficulty in discovering in the portrait of Lady Guildford. [Half length, walking to. A stout, proud, portentous, angry-looking woman. Dressed with much pomp and circumstance. Anne Boleyn head-dress, black veil behind gold brocade in front. Magnificent slashed gold brocade sleeves, slashed with white; many gold chains. Closed book and rosary in handsome hands. An orthodox woman returning from mass. Background—plaster on left, blue sky and fig tendril across it. Pose most characteristic of her. Face puffy and selfish, cruel brown eyes, a cold but handsome woman. A splendid glowing mass of colour and light.] No portrait known to me possesses these qualities more emphatically. The lady is not an attractive person, because we see her character so plainly, and it is an unattractive character. She is self-satisfied, self-conscious, proud, portentous, and scornful. There is a settled look in her face that marks an overbearing disposition. She is an orthodox person of the old school, on her way to mass, prayer-book and rosary in hand. There is pomp in her walk; dignity of a put-on kind. Her figure suits her mind, and the artist has not done anything to diminish the ponderousness of her form. So much for her character. Her expression is shown by the painter with an equal vividness. There is a glance in the eye; there are lurking traces of a bitter smile about the mouth; there is gesture in the holding of head and hands. Further emphatic of all this is the costume, which is of rich and heavy materials—velvets and brocades, all draped with chains of gold. The whole is set off by a background of elaborate architecture, and a blue sky crossed by a tendril of fig-bearing young leaves and bursting buds. The colours are rich and massed together into such a glowing harmony that whether you care about the person represented or not, you cannot choose but look at her, and your eye cannot fail of delight. Holbein, you must bear in mind, was not the inventor of portrait-painting, but only the greatest representative in the north of Europe.

#### *Early Portraits.*

Leaving out of account the sculptured effigies upon tombs, which scarcely professed to present the likeness of the dead, the earliest portraits of the Christian era are to be sought for in mosaics such as those at Rome and Ravenna. Popes, emperors, or some other wealthy and important personages, for the honour of God and their own glorification, were wont to decorate the apses of churches frequented by them with sumptuous mosaics. These mosaics were usually of one type, and represented the enthroned Judge of the world with the four-and-twenty elders on either hand, or the saints and apostles, and at his feet the lamb and the four streams of Paradise, and the sheep of his pasture, and the holy river and cities, and the palm trees of life, and the phoenix of immortality. Often, especially in the case of one pope whose name I forget, the munificent patron had himself depicted as presented to the Heavenly Judge by his patron saint. As time went on, pictures took the place of mosaics for mural decoration; they were multiplied too upon panels and in many other ways. The Madonna and Child, the symbol of the Divine ideal, were painted in every conceivable place—upon the walls of churches within and without, upon house fronts, upon book-bindings, upon panels. They were embossed on surfaces of metal, worked into textile fabrics, engraved upon copper, cut into wood—in fact, the ideal was made to take form by every process and in every substance that the ingenuity of man could devise. No altar, not even that of a private bedchamber, was complete without its picture or sculptured image of the Mother and her Babe Divine. At morning, at evening, and often at the other hours of the day, each pious man was wont to kneel in prayer before some such symbol of the Divine presence. This picture of the Virgin and Child, with a portrait of the person for whom the picture was made kneeling before them, and usually presented to them by the patron saint, could not fail to become common. At first the dignity of the Divine personages was symbolised by their great size compared with the donor, as, for instance, in the remarkable and famous Madonna picture belonging to the Archbishop of Cologne, painted by some great artist of that city during the fourteenth century. A hundred years later comes the Duke of Devonshire's Memling, where the Virgin still retains something of her old majesty, but the humanising element has been at work—she is no longer a mystic ideal drawn from a land of dreams, but almost a woman such as you might meet in the streets of Bruges in those days. Sir John Donne and his wife and child are, moreover, far more unimportant accessories. The knight's face, indeed, is perhaps the most attractive part of the whole picture—the feature which in the long run most tends to rivet the spectator's eye. The Virgin is interesting in so far as she is human; the Child in so far as he is a type of human babyhood; the old mystic ideal has lost its power. On the other hand, the donor is entirely human. We can see him and comprehend him as a visible man; he is such an one as ourselves placed in that strange environment. The element of complete humanity once introduced, the result which followed might have been predicted with certainty. Artists wanting in force and originality, such as the painter of the school of Gheerardt David, who made the picture which hangs under that artist's name in the gallery, adhered to the worn-out types, but with steady diminution of power. The life went from their work, and they could not conjure it back. All living and developing minds are inevitably carried forward along a certain road of advance. They cannot stand still or adhere to a bygone taste, however good the spirit may have been that once inspired it.

#### *Individuality.*

At the close of the fifteenth and the opening of the sixteenth centuries—the period of beginning of the so-called Reformation—the tide set with a flood of power such as did not come again till the period of the French Revolution. Men were becoming conscious of their individuality. They were refusing, they were being driven by the force of circumstances to refuse, any longer to be restrained and cramped within the boundaries of an universal creed. The movement for individual freedom of thought was begun. The revolt against authority in matters of opinion was inaugurated. As many men, so many different opinions; as many men, so many varying points of view; as many men, so many characters, so many modes of life, so many kinds of action. The social and religious machinery of the Middle Ages was breaking up. The units were forced to enter into new combinations. The swing and rhythm of the old life had ceased. New worlds were to be discovered, new spheres of action were to be found, new schools of thought were being formed. In such a day the joy of existence and its perils were great. "Oh, century," cried Ulrich van Hutten, "intelligences are waxing, studies are flourishing; it is a gladness to live." Where could a man of the old school find a peaceful resting-place in such a day? He must forward. He could not halt. The storm and throng of things carried him forward. He might resist, but what of that? Could he withstand the impetus of the earth in its orbit? Poor unit! Forward! There was the only hope! Thus art, the exponent of all fine thought, was inevitably driven into new areas. The Madonna became himself or vanished from the painter's canvas. Artists have to live by painting what their patrons want. The Fuggers

and the Nuhofs—Rothschilds of their day—men whose interests were spread abroad through all the known world, whose ships ploughed the troubled waters of every sea, whose wealth was the borrowed strength of monarchs, and their personalities the guiding force of industries that ramified throughout Europe and the East, such men wanted to leave monuments of themselves. It was to them that others came, because of the power that their own personalities had gathered about them, not because of the prestige of their office or the inherited glory of their name. The sixteenth Duke of Windlestraw might die, and the seventeenth would take his place and bear his honours with the added dignity of one more generation; but the head of the house of Fugger wielded a more individual power, and could not be certain of passing on his qualities with his name. The individual required an individual movement, and we cannot but recognise the rightness of feeling that there was in this. The portraits of that day which have come down to us possess an overwhelming interest, because in almost every case they are portraits of men who made an individual mark, men who in history remain individuals to the present day. Look back to the thirteenth, fourteenth, and first part of the fifteenth century, and you will find that though there are men who do stand out before us as individuals, they are relatively few. The great architects and painters are forgotten—they sank themselves willingly in the multitude of their fellows. Statesmen, unless of supreme eminence, are little more than names. The moving forces are continually anonymous. You have to look for the secrets of political life to corporations, municipalities, and guilds. Now come to the age of the Reformation. Everywhere individuals rise up in your memory. Great authors, great preachers, great artists, great soldiers, great discoverers, great merchants, great statesmen, great men of every kind. How comes this? The stuff is the same; its quality by no means inferior; the works left behind are not of a better average of excellence. Sixteenth-century architecture will not compare with that of 300 years earlier. The change is a change of circumstances; the men are different, because the work they have to do is of a different kind. Each individual is cast upon his own resources, and has to make the best of himself. If he fail it is because the stuff in him is not stout enough, the mind in him not wise enough. If he succeed it is mainly himself that he has to thank. "Oh, century, to live in thee is a joy!" It is an age of correspondence, of travel, of wide-reaching friendships. The leading men of Europe know one another. They have mostly, at some time, seen one another. Erasmus knows and corresponds with all the famous men of Europe. Dürer is found writing to an English friend. Holbein carries letters of introduction from country to country. A European press springs up, and the age of pamphleteering begins. A man's individual opinions have weight. A man's following begins to include multitudes whom he has never seen, but to whom he is, nevertheless, well known. Thus the need for portraits becomes pressing. Every one of eminence is obliged, willingly or not, to submit to pourtrayal. Friends and admirers pester him for his picture. If he be a great party leader his likeness is cut upon wood or engraved on copper, and prints of it are hawked about country markets and fairs all over Europe. They find their way into the cottage and the shop, as well as the palace. The face of a man becomes an important factor. Artists everywhere have to give themselves up to portrait making in one form or another. Dürer's diary shows us how great a part of his time was thus spent. Never did a day pass but he had to draw in pencil, or crayon, the likeness of some friend or other. After dinner he seldom failed to immortalise his host. His skill as an engraver was likewise so employed. We find Erasmus pestering him by letter for four years to engrave his likeness. Thus the whole whirl and tumble of a progressive art went forward. A great portrait painter could not but arise sooner in the midst of it all; and arise he did in the person of the pauper's son of Augsburg. It is curious that amongst all the people of pronounced individuality of that day Holbein, with his keen insight into character, his high position as a workman, his continual contact with men of light and leading, who have left us such numerous word-pictures one of another—it is curious, I say, that Holbein should himself remain so little of a personality to us. We know next to nothing about him except what he himself permits us to infer from his work. His contemporaries tell us nothing to speak of about the man himself, though their references to his work are frequent. The contrast between him and Dürer is very remarkable in this respect. Whoever saw Dürer was more struck by the man than the artist, great though his admiration for his art might be. When he died his loss was loudly lamented all over Europe. Holbein passed out of the world, and no one noticed that he was gone. The man had been a looking-glass, so clear that people hardly noticed him—saw only themselves reflected in him. The virtue of the portrait-painter is to annihilate himself, and this Holbein did to a remarkable degree. Like Shakespeare, he held a mirror up to nature; and, like Shakespeare, it was not till long after his death that his real greatness became apparent. He lost himself in his subject, spoke little we should judge, wrote hardly at all, but spent his life doing with splendid and silent veracity the work that was given him to do. He gave centuries of existence to his followers, and won alone a living name for himself. His influence in the domain of art reigned supreme for many years. If he had

not many pupils, he certainly was the leader to many followers more or less excellent, and, like him, for the most part little known except by their works. Of portraits by such men the loan collection has more than one to show, the portrait of Lady Abergavenny being perhaps the most notable. It is, however, in the old houses, guildhalls, and especially in the college buildings of our ancient universities, that such works are to be found in greatest abundance. They are not considered worth showing to the public, and so they lie neglected and unknown for the present, but their day will come.

In the natural movement of things, no product of civilisation is anything but transitory. Arts rise and pass away like all else that is human, and the greatest of schools has but its day, and then decays, and makes place for something else. The sixteenth-century school of portraiture was not very long lived. Two, or at most three, generations saw both its rise and decline. It was an art, as you have seen, dependent entirely upon social conditions, and social conditions changed rapidly in those days. Between the pictures of Holbein in the reign of Henry VIII., and those of Zucchero and his fellows in the reign of Elizabeth, there is the whole difference of an epoch; and the reason for this is not far to seek. The courtiers of Henry were in some cases, notably Wolsey's, men of great magnificence of life. They built for themselves sumptuous palaces, surrounded themselves with multitudes of retainers, and fared sumptuously every day. But such men were very few in number, and were regarded as attempting to rival the monarch in expense, and thus perhaps even in power. Life as a whole was still a tolerably simple affair, and the best and most enlightened men lived with little more show than their forefathers.

### THE HAWICK MEMORIAL COMPETITION.

A MEETING of the subscribers to the Duke of Buccleuch's memorial was held in Hawick last week. A report by the committee recommended that the plans prepared by Mr. Guthrie, architect, Hawick, be adopted; that these plans be sent to the Science and Art Department, with the view of ascertaining the amount of the grant to be obtained; and also that the Antiquarian Society be asked to intimate the sum they intend subscribing. If these sums, together with the remainder of the subscriptions to be called in, were found sufficient to meet the expense of the building, which was expected to cost (exclusive of the heating apparatus) 2,545*l.*, the committee suggested that the work be proceeded with. This report was agreed to by the subscribers. A letter from Mr. Fairley, architect, Edinburgh, whose plans had been selected by Mr. M'Lachlan, who was appointed for that purpose, was also read, Mr. Fairley complaining of ill-treatment. The subscribers resolved to pay the unsuccessful architect the sum of 10*l.* 10*s.* as compensation for his labour. On the suggestion of Provost Watson, the meeting agreed to instruct Mr. C. O. Murray, London, a native of Hawick, to make an etching of the memorial portrait of the Duke of Buccleuch, at present on exhibition in the Hawick Art Galleries, and to arrange with publishers for the issue of the same.

### FIRE PROTECTION.

ON the 19th instant a trial took place with a new and self-propelling floating steam fire-engine, constructed by Messrs. Shand, Mason & Co., to the order of the Bristol Corporation, for the protection of the docks and waterside property in that city. The hull and propelling engines have been constructed to the specification and under the superintendence of Mr. J. W. Girdlestone, engineer to the Bristol and Avonmouth Docks, while the fire-engine is similar to one supplied in the early part of this year to the Metropolitan Fire Brigade, which has proved so successful at several waterside fires that two others are now in course of construction by the same makers. The experiments were conducted in the presence of Captain Shaw, C.B., chief of the Metropolitan Fire Brigade, and Mr. Wingfield, superintendent of the Bristol Fire Brigade, and were carried out in a satisfactory manner. At a previous trial a few days since at the measured mile a mean speed of 8.9 knots per hour was obtained, which, considering the size and special construction of the boat, proved very satisfactory. The boat is of steel, 53 feet long and 13 feet 6 inches beam, built in four watertight compartments, the screw propeller being driven by a pair of high-pressure engines, supplied with steam from the fire-engine boiler. The fire-engine is Shand, Mason & Co.'s "Equilibrium," discharging 1,100 gallons per minute through a 2-inch jet, reaching under favourable circumstances a height of 200 feet. There was no opportunity of testing the height on this occasion, but a water pressure of 140 lbs. per square inch was obtained, the steam pressure being 110 lbs. The boiler is of Shand, Mason & Co.'s patent inclined water-tube construction, which has been successfully in use for fire-engine and other purposes for fifteen years. The boat will be taken through the canal to Bristol in a few days, and finally tested there in the presence of Mr. Girdlestone and the Bristol authorities.

## NOTES AND COMMENTS.

A CAPITAL shilling handbook on "The Art of Oil-Painting" has been published by Messrs. LECHERTIER, BARBE & Co. It is by Mr. JOSEPH BOUVIER. We have rarely met with so much information in fifty pages. Mr. BOUVIER knows how to write with brevity, and has compressed many hints into his little book. He gives his reader the benefit not only of his own experience derived from practice in this country and on the Continent, but reveals methods of other artists. Thus we are told that ETTY sometimes produced his marvellous flesh by using emerald green for the second painting before glazing. If we remember rightly, DELACROIX followed the same plan. UWINS told Mr. BOUVIER that "he generally mixed vermilion and black for his shadow tints." LANDSEER, when painting dogs, put in "the light tints with a very full brush, and when dry scraped them down with well-sharpened razors, after which he glazed freely, and dragged his lights thinly over, which gave the gloss of the silky hair." There is reason in these methods; but what is to be said of an English artist who attempted one of TITIAN's masterpieces in the Louvre with nothing but ultramarine and white, hoping to gain the effect by glazings? The French copyists in the gallery must have believed that the English were as eccentric in art as in other things.

FROM an agreement which has been published it would seem that M. DORÉ, civil engineer, did not anticipate any other future for his son GUSTAVE than that of being a dexterous lithographer. In the document it is stated that M. DORÉ, having a desire to develop the talent of his son, GUSTAVE DORÉ, then of the age of sixteen years, had entered into an engagement with M. CHARLES PHILIPON, of 29 Place de la Bourse, Paris, and that the latter undertook to procure for GUSTAVE DORÉ lithographic work, to be executed either with chalk or pen. The engagement was to last for three years, and during that time GUSTAVE DORÉ was not to execute a drawing for any other employer. M. PHILIPON was to commission at least one drawing a week; but young DORÉ was not to be bound to do more than one if his studies, holidays, or illness prevented him. It is evident that M. DORÉ was anxious that his son should continue his literary studies. Whilst the negotiations were in progress GUSTAVE DORÉ sent some sketches to a comic journal, and it was at once recognised that another genius had been enrolled in the ranks of book-illustrators.

A SEMI-PRIVATE exhibition of rather more than ordinary interest has within the last few days been held at the Boltons Studios, South Kensington. It consisted of a selection of pictures and studies by Mr. FRANCIS BATE, an artist of foreign sympathies and foreign training, whose reputation is steadily gaining ground in this country. In practice an Impressionist, his inclination is especially towards the pictorial treatment of those varying effects of open-air light to which as yet comparatively few British artists have given their attention. He has taught himself to see Nature, and the individuality of his practice is unquestionable; but it yet remains to be seen how far he will be successful in gaining his fellow-artists over to his side. His exhibition is at all events worthy to be put on record as a practical exposition of an original conception.

By a majority of one vote, M. DIET has been elected a member of the Académie des Beaux-Arts in succession to the late M. PAUL ABADIE. His competitors were M. DAUMET and M. NORMAND. M. DIET received seventeen votes at the first trial and eighteen at the second, while M. DAUMET received sixteen and seventeen votes. M. NORMAND obtained but two votes. M. ANCELET's name was mentioned, but he had no share in the voting. The completion of the large hospital, the Hôtel Dieu in Paris, has been carried out by M. DIET. The completion of the Palais de Justice in Paris, the restoration of the château at Chantilly, have been entrusted to M. DAUMET, and he has succeeded M. ABADIE as architect of the great church which is in progress at Montmartre.

HOWEVER disappointing trade returns may appear, there are fortunately plenty of people who are able and willing to invest in pictures at prices which are satisfactory to the artists. One out of every three of the works in the late exhibition of the Royal Institute of Painters in Water-Colours has been sold. In other words, 1,083 pictures were hung in Piccadilly, and

365 were bought in the galleries. The prices ranged from five to four hundred guineas, and the sum expended amounted in all to 12,335*l.* 8*s.* The experience in Liverpool has been likewise satisfactory. Last year at the Autumn Exhibition 226 works were sold, realising 8,472*l.* 10*s.* 6*d.* This year the number of pictures sold was 272, the value of which was 11,147*l.* 9*s.* 6*d.* Statistics are rarely so interesting to artists as in these cases.

THE railway system of New Zealand is being expanded by a line which will connect the town of Wellington, the most southerly port of the northern island, with the railways north of the Manawatu district. This is owing to private enterprise, and will furnish railway communication with the rich agricultural districts of Wanganui and Taranaki. The Manawatu plains begin at a distance of between thirty and forty miles from the town of Wellington. As the traveller leaves this town he follows a road skirting the base of the hills, and washed by the mingled waters of the harbour and an inflowing river. After a mile or two he would turn up a branch road on his right that runs through a gorge in the hills, just near the spot where stood a picturesque moss-covered water-mill. For twelve miles or so the road goes over undulating ground through a forest, whose trees are not unseldom to be seen nine, ten, twelve feet in circumference, some even exceeding that in girth. Emerging from this, the waters of Porirua harbour are seen and skirted, and most likely two or three long carved canoes owned by the swarthy New Zealanders are drawn up on the strand. Then comes another stretch of timber for miles over decidedly hilly country. Issuing at length from the shelter of the forest, the traveller finds he is skirting the open ocean, its waters 2,000 feet below him, while the Manawatu plains stretch away in front to the north. A descent of two miles brings him to the plains.

A BILL has been lodged by the magistrates and council of Glasgow, with the object of acquiring powers to borrow a sum not exceeding 250,000*l.*, for the maintenance and repair of a large extent of roads and streets which were formerly turnpike, the preamble stating that those roads and streets and others in the city are in bad repair, and that from the great traffic upon them it is expedient that they should without delay be paved in a substantial manner. The sum of 50,000*l.* is to be applied in connection with the construction and repair of sewers, a further sum of 50,000*l.* is to be applied for general police purposes, and the remaining sum of 150,000*l.* is to be borrowed on the security of the Roads and Bridges Act assessment, and is to be applied in executing the provisions of that Act. The Water Commissioners have introduced a Bill for the extension of the water supply, for which purpose a sum not exceeding 1,000,000*l.* will have to be raised, in addition to the 2,000,000*l.* authorised to be borrowed by previous Acts.

A RUSSIAN professor has been experimenting on the best way to remove dry rot. He says that a thorough draught will destroy the parasite within twenty-four hours. If the action of draught be assisted by that of sunlight, a few hours will often suffice to put a stop to further damage. A concentrated solution of common salt is very efficacious, and the stronger it is used the more rapid its action. The action of a concentrated solution of cupric sulphate (blue stone, blue vitriol) is still more energetic and complete than that of common salt. Crude carboic acid is rapid in its action and cheap, but inconvenient to use. But he considers that the best, cheapest, and most convenient material to employ is the tar obtained when birch wood is distilled for acetic acid; the under surfaces of the flooring are painted with the tar.

THE timber-measuring case, which was tried in the Queen's Bench Division, is certain to be heard of in every court where a barrister is allowed to practise. With a railway company on one side and an association of timber merchants on the other, there is no fear about fees. The old-fashioned established way of measuring trees is by the string. If the railway companies consider that it is inaccurate as a test of weight, why are not special weighing-machines devised by them? What is called a ton of timber is only an approximation, forty feet of one kind being supposed to be equal to fifty of another kind. But, as performed by railway porters, the measurement is but a rough-and-ready operation, and is very different from what is done in a private timber wharf.

## ILLUSTRATIONS.

HOUSE, THE RIDGEWAY, ENFIELD.

THE house shown in the accompanying illustration has been recently erected on the Ridgeway, Enfield, for Mr. H. C. WELD. The works have been carried out by Mr. MONK, of Edmonton, from the designs and under the supervision of Mr. JOSEPH S. MOYE, architect, 3 Southwick Street, Hyde Park Square.

DESIGNS FOR GOLDSMITHS' WORK.

WE publish two designs for silver dishes, by Mr. W. R. LETHABY. One is to be pierced and engraved, and the second *repoussé* and parcel gilt. They are a great improvement on what is generally produced in this country, but manufacturers ascribe all defects to the action of the Exchequer in levying too high a duty on plate.

THE BRENTFORD DISTRICT SCHOOLS, ISLEWORTH, W.

THE buildings shown in the illustration have been lately completed for the Poor Law Union of Brentford.

*Block No. 1* is the girls' and infants' pavilion, and accommodates 107 girls and 37 infants. It contains on the ground floor:—Girls' school-room, 53 feet by 18 feet; girls' class-room, 18 feet by 12 feet; girls' day-room, 62 feet by 18 feet; serving-room, 28 feet by 12 feet 3 inches; infants' school-room, 18 feet 6 inches by 18 feet; infants' day-room, 18 feet 3 inches by 18 feet; girls' mistress' sitting-room, 14 feet by 12 feet 3 inches; infants' mistress' sitting-room, 14 feet 3 inches by 10 feet; teachers' room and girls' library and reading-room, 14 feet 3 inches by 10 feet; girls' bath-room, 25 feet by 10 feet 9 inches; girls' lavatory, 25 feet by 10 feet 9 inches; 19 w.c.'s. On the first floor are two dormitories, 71 feet 3 inches by 18 feet 9 inches, one for 35 beds and cubicle for monitor, and the other for 37 beds; infants' lavatory, 14 feet 6 inches by 10 feet; infants' mistress' bedroom, 14 feet 6 inches by 10 feet, and w.c. accommodation for night use. The accommodation on the second floor is similar to that on the first floor.

*Block No. 2* is the boys' pavilion, and accommodates 108 boys. It contains on the ground floor:—School-room, 53 feet by 18 feet; class-room, 12 feet by 18 feet; day-room, 62 feet 6 inches by 18 feet; masters' sitting-room, 15 feet 3 inches by 10 feet; teachers' library and reading-room, 15 feet 3 inches by 10 feet; bath-room, 25 feet by 10 feet 9 inches; lavatory, 25 feet by 10 feet 9 inches; tailors' shop, shoemakers' shop, and carpenters' shop, each 20 feet by 13 feet 6 inches; 10 w.c.'s and 12 urinals. On first floor are two dormitories, 53 feet by 18 feet 9 inches, one for 25 beds and cubicle for monitor, and the other for 27 beds, masters' bedroom, assistant-masters' bedroom, and w.c. accommodation for night use. The accommodation contained on the second floor is similar to that on the first floor.

*Block No. 3* is the administrative block, and is capable of administering to the wants of 300 children, containing on the ground floor:—General dining and recreation hall, 50 feet 9 inches by 36 feet; serving-room, 21 feet by 10 feet; kitchen, 23 feet by 20 feet; scullery, 20 feet by 13 feet; ten lock-up rooms for stores, 13 feet 6 inches by 7 feet, with space for unpacking; committee-room, office, chaplain's-room, matron's cutting-out room, officers' mess, and sitting-room. Three rooms for superintendent, training kitchen, training scullery, wood and coal stores, entrance hall, vestibule, and corridors 9 feet wide, all round dining-hall. On the first floor, approached by separate staircases for boys and girls, is a chapel 69 feet by 25 feet, and six bedrooms for officers.

*Block No. 4*.—Swimming bath, boiler-house, and laundry block for 300 children contains:—Swimming bath, 26 feet by 22 feet, with dressing-room attached; boiler-house, 35 feet by 24 feet, with chimney shaft 55 feet high; laundry, 34 feet by 21 feet; drying closet, containing eleven "horses"; wash-house, 24 feet by 19 feet 3 inches; receiving-room, 24 feet by 10 feet; and airing and drying-room, 17 feet by 24 feet.

The whole of the buildings, with yards, &c., cover an area of about  $3\frac{1}{2}$  acres, and are laid out as boys, girls, and infants' playgrounds, laundry drying ground, and general yard. Each of the playgrounds contains a covered portion, with asphalted floor, 100 feet long by 16 feet wide, and the whole of the blocks of buildings are connected together by covered corridors 6 feet wide.

The cooking is done by means of steam and gas. All the

fittings, both for cooking and laundry purposes, boilers, &c., were supplied by Messrs. ROSSER & RUSSELL, of Hammer-smith; the gasfittings were executed by Messrs. DEFRIES & SON, of Houndsditch; the water-closets throughout are fitted with BOSTEL'S Brighton "Excelsior" flush-out apparatus; the children's latrines are fitted up with Messrs. BOWES, SCOTT & READ'S patent self-acting flush-out closets; the dining-hall, chapel, corridors, &c., are heated by hot-water pipes and apparatus also executed by Messrs. ROSSER & RUSSELL; the remainder of the rooms are warmed by SHORLAND'S patent Manchester grates.

The schools were erected by Mr. THOMAS BRUNSDEN, of Brentford, from designs by Mr. EDWARD MONSON, junr., A.R.I.B.A., of Grosvenor House, The Vale, Acton, W.

DESIGN FOR NEWCASTLE HOSPITAL FOR INFECTIOUS DISEASES.

THIS design, the joint production of Mr. MARK J. IANSELL, of Bedford Row House, and Mr. WALTER J. H. LEVERTON, of Wandsworth, was awarded the second premium in the recent competition.

It is on the pavilion system, with single pavilions, in order to obtain as much isolation as possible, and all the wards are on the ground floor.

Six pavilions are to be built at once, but the conditions required the plans to be arranged so that four or six additional ones could be added subsequently.

The administration block is kept to the front in order to be easily accessible to outsiders. A separate entrance-gate is provided for bringing in patients.

The wards are designed on a modification of the "Tollet" system. They are raised and isolated from the ground on open arches. The ceiling (which in the Tollet system is in the form of a pointed arch, with extraction openings at the apex) is taken up the underside of the rafters, and the junction with the walls rounded off. By this arrangement all the advantages of the Tollet form, with regard to ventilation, are obtained at a much lower cost.

The axes of the wards are placed east and west, so as to have no intervening spaces swept by the prevailing winds, and to obtain verandahs on the south sides into which the patients could be wheeled. Hollow walls are used, rendered internally with Parian cement. The drawings illustrate, in a very complete manner, the various details of the scheme, in which all the latest improvements in hospital planning have been introduced.

The heating is by open ventilating stoves, assisted by steam. The laundry apparatus, which is Messrs. BRADFORD'S, is also worked by steam.

## THE COLOUR CLASS OF THE ARCHITECTURAL ASSOCIATION.

THE work submitted in competition for the prize in the Class of Colour Decoration, 1884, has been examined by Mr. Aitchison, A.R.A., who has kindly prepared the following report:—

I think, having regard to the quantity of studies, to the care bestowed, and to enough being completed to judge of the whole, that Mr. Hennings is entitled to the first place. His *Municipal Hall* is complete and fairly harmonious. The tone of his *Drawing-Room* is also fairly harmonious; though the colour is not agreeable, his ceiling is well carried out. His *Opus Alexandrinum Pavement* is neatly drawn; and his detail of the *Altar Cloth* the most complete of any sent in, though nothing can be said for it in point of colour.

Mr. Lewis seems to occupy the second place. His drawing of the *Side of a Hall*, in orange, is mainly marred by the pale blue lines, which are too wide and not the right colour, as they produce a dazzling effect. The two long panels of his dado in his red hall are very successful. The detail of his *Altar Cloth* is carefully drawn, and, with the correction of some harsh lines and more delicacy and vigour in the termination of his leaves, would be effective.

If the exhibition of real taste and inventiveness in colour were to take the palm, I should give it to Mr. Woodward. His sketch detail is the best bit of colour exhibited. He has, however, made the two white bands separating the yellow ground from the border too wide; they divert the eye from the main white of the crane, and should be reduced in width, or, what would perhaps be better, be toned by a light grey pattern. Portions, too, of his *Altar Cloth* are very good—the deep crimson with pale pink fleur-de-lys, and the harmonies of grey-blue, brown, and gold of the border. So also is the brown monogram edged with gold on the pale pink.

The effect of the whole cloth is spoiled by bands of raw white. As a rule, colours should be separated from one another by fine lines of gold, black, or white, as circumstances require.

Mr. Miller also shows considerable taste for colour in his rough sketch of a ceiling, where the dark gold and grey-blue festoons and flesh colour of the cupids tell very effectively on the light red ground; the pea green of the border is unhappy. There is some promise of vigour in his Turkey carpet, only the pea green and yellow are too crude.

Mr. Pite should elaborate his sketch for the *Pompeian Hall*, and send it to the Royal Academy for exhibition; the idea of black, chocolate, tawny-red, and orange shot with red in succession is original, the spacing is not quite right; the dado band of dull green and black spots is very good in its place, if he had kept his white lines very fine. His upper band above the door is a discord, and his frieze is not a success; windows should never be put in a wall for coloured decorations.

Mr. Inglis also shows taste in colour in his *Side of a Hall*. By candlelight, the pale puce, yellow, white and black are very harmonious, and his little figure on a black ground on the yellow panel, but by daylight the yellow is too coarse and the pale pink does not harmonise; his ceiling, too, is harmonious.

Mr. Herbert's *Pompeian Hall* is not without merit, though the wide bands of scarlet on yellow is a little barbaric; the white lines are in many instances too wide, and the white animals in the dado in the wrong place; the doors want something in the panels, and also the black wall panels want figure or ornament.

Mr. Adkins's *Altar Cloth* is also fairly harmonious, and he has fairly well managed his white bands; the upper ornaments are too large, and the blue and green are not quite right.

The Colour Class is to be congratulated on the great improvement shown, and those who are interested in colour and have a natural gift, should consider no time thrown away in mastering the art: it is purely for delight, and, if not delightful, is worse than whitewash. What Horace says of bad poetry, that neither men, gods, nor booksellers can endure it, is equally true of bad colour.

## THE SCOTTISH NATIONAL PORTRAIT GALLERY.

ANOTHER important step towards the realisation of a Scottish National Portrait Gallery has just been taken, says the *Scotsman*, in the adoption by the Board of Trustees for Manufactures of plans by their architect, Dr. R. Rowand Anderson, for the construction of the necessary buildings. The design holds out the promise of a building which will at once admirably meet the requirements of the case and prove a notable architectural ornament to the city. The funds at present available will not admit of its being immediately carried out in its entirety; but enough will be done to provide all, or nearly all, the space that is intended to be allocated to the Antiquaries, and to afford more room for pictures than is likely to be occupied for years to come, while giving such a favourable impression of the artistic character of the building itself as may be expected to foster a general desire for its early completion.

The site is the vacant ground in Queen Street, between North St. David Street and North St. Andrew Street. In shape a regular parallelogram, measuring some 260 feet in length—that is to say, along the line of Queen Street—by about 70 feet in width, it readily lends itself to the construction of long galleries, capable of being thoroughly well lighted. It is to the providing of this sort of accommodation in the most convenient form that Dr. Anderson has, in the first instance, directed his attention. The result is a design distinguished, like his work generally, for purpose-like simplicity of internal arrangement. In its complete form this embraces two sets of galleries, exactly similar in size and number, one set on either side of a central vestibule and hall; but at present the back portion of the set on the west side, appropriated to the portrait collection, is not intended to be fully carried out. The block to be now constructed will thus assume the form of an oblong, with a space of the same shape left vacant at the south-west corner. The building is to be of three storeys, with a basement on the side next the lane; the ground and first floors being lighted by side windows, the upper floor entirely from the roof. In the centre of the Queen Street front will be the main entrance, giving access to the vestibule, which measures 25 feet by 13 feet, with a lavatory at each end, and from which one will pass to the central hall, designed to be 44 feet square. The vestibule has only the height of the ground floor, but the hall rises into the first floor, on which level it presents an open corridor supported on an arcade, the lighting being by windows in the back of the building. From the ground floor of the hall access will be afforded to the galleries right and left, as also to two staircases, one on either side, that lead to the upper floors. On the first floor it will only give access to the portrait gallery on the west side; the east wall, from this level upwards, forming a substantial partition between the portion of the building assigned to the Antiquaries and that appropriated to the portrait collection. The accommodation for the latter, as

at present arranged, is to consist of three galleries, one on each floor, on the north or Queen Street side of the block, severally measuring 82 feet by 26 feet; a room over the vestibule, on the first floor, and, on the second floor, one extending over both hall and vestibule, whose dimensions will be about 60 feet by 44 feet. For the Antiquaries, again, there are to be provided, on the east side of the hall, three galleries of 82 feet by 26 feet on the Queen Street side, exactly corresponding to those set apart for the portraits, and three more of 60 feet by 26 feet on the south or lane side of the building, together with ample storage room in the basement. The space to be, for the present, left vacant on the portrait gallery side corresponds to that occupied in the eastern section by the smaller set of galleries. In the absence of any urgent demand for space, the question of finishing off the wings of the building, for which alternative designs have been submitted, to cover a space at each end of 20 feet in frontage by 70 feet in depth, may remain in abeyance for some considerable time. Besides the storage space appropriated to the Antiquaries, the basement will afford plenty of cellars, as well as accommodation for the necessary heating apparatus.

The style of architecture adopted is the Gothic of the latter half of the thirteenth century, as applied to secular purposes. In making his selection, Dr. Anderson has been guided by considerations of utility as well as beauty, the style in question being one which readily adapts itself to the providing of sufficient window openings for such of the galleries as must be lighted from the side. The building accordingly will bear its character on its face, presenting a notable example of the good results to be obtained by recognising the prime importance of internal arrangements, and adjusting to these the forms which are to be relied on for external effect. On the ground floor of the Queen Street façade is a range of large pointed windows, separated by massive piers. Over each of these, on the first floor, is a pair of coupled windows, also pointed and enclosed within a pointed arch; the piers intervening between the pairs being formed into niches, with pinnacled canopies for the reception of statuary. The main entrance is a pointed doorway, deeply moulded, and forming the leading feature of an effective central elevation, finished off atop as a gable, and showing a row of niches over the door, and a triple window on the first floor level. The upper flat of the frontage, corresponding to the second floor, presents an expanse of plain wall that will serve as a foil to the telling effects of light and shade realised from the niches and window openings of the lower storeys. The south side of the building next the lane will be treated in the simple style befitting its position, due care being taken to provide for the adequate lighting of the ground and first-floor galleries. As has been indicated, no definitive resolution has yet been adopted in regard to the finishing of the wings. According to one plan they will have a rectangular form; while an alternative design offers an arrangement of round towers, one at each of the four corners, which, on paper at least, seems to add a desirable element of picturesque effect. The niches along the frontage are intended to be occupied with full-sized statues of notable personages—a scheme which should at once illustrate the desirableness of combining sculpture with architecture, and afford to Scottish practitioners of the former art a much-needed outlet for their taste and skill.

No time will now be lost in preparing the working drawings, and it is expected that building operations may be commenced early in the ensuing spring.

## THE LATE JULES BASTIEN-LEPAGE.

SOME letters have appeared in the *Figaro*, which reveal the difficulties attending the late Bastien-Lepage, the painter, during the early part of his career, and they are accompanied by notes by M. Macé de Challes, who was his friend. We learn that the painter was born in the village of Damvillers, which lies on the road between Montmédy and Verdun. In the local school his aptitude for art was remarked, and in course of time he was sent to the Ecole des Beaux-Arts in Paris. There he had to depend on the assistance which he received from home. The amount was, however, insufficient for his modest requirements, and an appeal was made on his behalf to the administration. At the end of 1873 he was glad to accept a donation of one hundred and fifty francs from the Minister. In the competition of 1875 he received only a second medal, and he was deeply moved by the disappointment. When he read the news in the courtyard of the Ecole des Beaux-Arts, he struck his umbrella against one of the posts and exclaimed, "The judges have not eyes to see!" His subject was *The Angel appearing to the Shepherds*, and, in one of his letters, he says that while painting the shepherds he thought much of Ribera. In 1874 Bastien-Lepage's portrait of his grandfather and his *Printemps* were exhibited at the Salon, when he was honoured with a third medal. Next year his portrait of M. Wallon brought him the second medal. He said he was enchanted; but there was some regret when he found that he was placed after painters whose works he disliked. In 1876 he tried again for the Prix de Rome, but he did not even secure a nomination. Three years afterwards, on the recommendation of the local deputy, he was enrolled among

the Chevaliers of the Legion of Honour, and for the brief remainder of his life he might be considered as successful.

M. Albert Wolff has rendered a tribute to the memory of his friend, of which the following translation may afford a notion:—

Everyone, except the painter himself, knew that Bastien-Lepage had arrived at the close of his life. He has been taken from us in his prime, and in him we have lost the greatest artist of the young French school. He may have been less known to the public than other men of inferior genius, but by painters and experts he was placed in the very first rank. His art was not a superficial art, neither did it depend on trickeries nor on the attraction of fashion. All its value was drawn from Bastien's subordination to nature, from his thoughtfulness, and the vigour with which he bent himself to his task. The slights he received might wound his sensibility, but they could not discourage him.

I have followed his career from the time when the portrait of his grandfather appeared in the Salon, and was regarded by the crowd of artists who surrounded it as if it were a revelation. I believed that this young man from the school of M. Cabanel was a master. The naturalistic movement had served him, but his picture was the first in which life in the open air was expressed in all its radiance. His precursors were men of talent. Bastien-Lepage, in seizing principles which had been established, and indeed formed the foundation of the new school, added the science which heretofore had been wanting. He brought to his work accuracy and sobriety, and used his mind as well as his eyes and hand. Bastien was at first poor and unknown when he came to Paris, so he sought a refuge in the southern district of Mont Parnasse, where life is less expensive than in other parts. His fellow-artists saw him rarely. To some of them he was a peasant who had yet to be civilised, to others he was simply a bear. He lived by himself, and was supposed to be unsocial; he spoke but little, and was said to be proud. He appeared to despise talk, or at least he was not anxious to refute his critics by speech, and in this spirit he acted to the end.

The truth is that Bastien was an artist and nothing else. He was retired because he was not eager to submit himself to other influences than his own will, and as he was never weary of his work he could dispense with the excitement of the Boulevards. I had written about him for several years without knowing him. The first time that I heard from him was after an article had appeared on his fine picture showing a peasant woman gathering potatoes. Seeing his efforts to attain simplicity and truth, I said I was confident that the artist would never be allured by thoughts of gain. The next day he wrote to me that I could take his word it should be as I said, and it was so.

The grandest title, the best homage that the critic can render to Bastien-Lepage is to say that he lived for art. His great works, such as the *Hayfield*, will testify to this. The subject may not please all, for it is only a man stretched on the grass, but the sentiment was admirable; there was a sense of air and light, and the picture became memorable by the spirit which the young artist had put into it. He had no wish to make pictures for the sake of selling them, and yet he desired to live. Portrait painting supplied his modest necessities. Among his first experiments was the portrait of his brother, for whom, notwithstanding the difference in age, he had an affection that was paternal. This portrait, when exhibited at an artists' club, was at once recognised as a masterpiece. It recalled Holbein. Bastien-Lepage was one of those who believe it is best for an artist to know his subject. To express the character of the original in a portrait was his ambition, and it may be said that in several of his works he has placed himself on a level with the greatest portraitists.

I have seen him at work. At his own desire he painted the portrait of myself, which has gone round the globe, and has been seen everywhere with wonder. He had then migrated across the river to the more expensive district near the Avenue Villiers. He said to me, "I wish to represent you working at your desk, amidst a litter of journals and manuscripts, in your office coat, and not dressed for a first night at a theatre." This was in winter. He arrived every morning at a very early hour, I posed before him and he posed before me. I can still see him leaning on the easel, with his eyes fixed on me, as if he wished to penetrate to my soul. His head was not well formed, but he was rendered almost handsome by the ardour and ambition which shone through his pale features. He was very often dissatisfied with what he had done, and painted out the work of the previous day. In the intervals of the sittings I had many an opportunity to study him. This young peasant was one of the most exquisitely organised of artists, with a mind that was open to every kind of intelligence. He confided to me his plans. It was only, he said, by compounding with one's conscience, and by submitting to the caprices of others, that it was possible to gain money. If he could only amass an income of 10,000 frs., he would live according to his fancy, and paint pictures for himself, and not for the market. Never was I more moved than by his avowals. His nervous movement and the emotion of his voice revealed how much he had thought of the subject, and how his desire had mastered him.

His portraits were not numerous, for the labour was difficult to him, and, as soon as he gained a little money, he fled from Paris to the fields. He brought back work which, whatever might be said

of the style, left no doubt of the great powers of the artist. Some pictures of country life were also produced, such as *The Forge*, a work which, when exhibited at the Salon, was not well hung, and, in consequence, lost some of its importance. My own belief is that Bastien-Lepage was better fitted to produce pictures on a small scale. His exquisite qualities are better seen in little works; in enlarging his figures, they seemed to lose sometimes the charm that belonged to the personality of the painter. It was surprising to see how much he could put into a simple head, and above all in a portrait. His powers appeared to be greater in proportion as they were concentrated in a limited space.

His great ambition was to paint the portrait of Victor Hugo, not, as he said, to advertise himself, for which there was happily no need, but because he wished to preserve a record of the features of the poet whom he honoured above all others. I obtained permission from the great poet to bring the young artist. On the evening that was appointed, Bastien-Lepage was paler than usual, he could not eat, and was as nervous as a school-boy. When we came to the house he said, "Don't let us go in yet, I am afraid." I asked what was his fear. "I believe," he replied, "that I can never venture to paint the portrait of Victor Hugo; to do so is to represent an epoch." Bastien was unable to finish the portrait, for the poet's occupations did not allow him to sit for more than a month. But a result of his visits to the house was a *chef d'œuvre* in his portrait of Madame Drouet, a small picture which, from its sincerity and as a study of character, may be placed by the side of one of Albert Durer's works. The lady is there before us, with the traces of her remarkable beauty, her delicacy, and her suffering, for the artist recognised the struggle of his model against the fate that was closing round her. The poor artist had only reached his thirty-fifth year when he died, surrounded by works which are the witnesses of his career. *La Soirée d'Automne* will go to the Louvre, where it will be recognised as a manifestation of the aims of the young school of France, and as a consolation to those who have to contend with the current of routine.

## ART AND INDUSTRY.

AN address was delivered by Mr. Gambier Parry at the distribution of prizes to the students of the Gloucester School of Art on the 17th inst. Mr. Parry said:—I have addressed the pupils of this school for many past years, and have occasionally singled out special subjects among the many that are taught here. I have addressed the scholars on elementary art, on the reasons for adopting the methods pursued here; I have specially addressed them on painting and on architecture and on the poetry and beauty of fine art. This evening I more particularly address myself to those who attend what are known as the artisan classes; and I request their attention to a few words about their work here, and what it is that this school offers to them.

They have often rather mistaken the real use of the school to them. These Government schools were originally devised for the artisan classes, and such among them as showed ability to rise to the higher grade in their own particular trade, and from that to advance, if they showed that still further ability to rise to the practice of ornamental and inventive art, as many in past and present times have done. I refer particularly to those pupils who attend the classes for building construction and machine drawing, and who have expected to learn what no such school could teach them of their trades. I want them to see what real good, real value this school can be to them, though it may not be exactly what they at first expected.

The master of an art school cannot also be a master carpenter or a master mechanist, but what he can teach, and what appliances and models in this school were designed to teach, is neatness of handling and correctness of eye. No workman of the common rough kind is attracted to such a school or such work as is found here. None but such as have an ability above their fellows will have the taste or inclination to the quiet work of this place. The carpenter, the builder, the machinist, who comes here is one who, from the very fact of coming, may be sure of the possession of ability to advance in his work; but he must understand in what way he will be taught to do so. He will not be taught to use his carpenter's tools better, to lay bricks better, or to make machinery better, but the result of his teaching and work here will be to do all those things better by clearing his mind about them, by learning to see finely and clearly what he only knew in a rough practical way before; and he will obtain this advanced knowledge and skill by the indirect way of learning about various things and subjects which apply to those of his own particular trade, and widen and enrich his mind about them. For instance, it is easy to perceive how much clearer a man's mind is on any subject when he can put it down on paper, whether by drawing or writing. Art, that is to say the particular purpose of this school, is a form of writing. A design is the writing in the best form of language for its purpose of any object in a man's mind—no other mode of language so perfectly describes the idea a man had formed, whether of a mechanical construction, a piece of building work, or a machine;

see, then, how valuable the lessons are that are gained by work here. The clearer a man's ideas are on anything the better he will do it. Now the process of putting them upon paper is one both of analysis and synthesis at the same time; it is a powerful form of education, and as it teaches the special, the best language for its expression, it is worth a man's trouble and time and perseverance.

It may seem to him at first that the subjects he is called upon to pursue here have no bearing on the one he has specially at heart. What has geometrical drawing, or perspective, to do with such trades as his? I can only reply that they teach him to see things scientifically, to understand things in all their relations and attitudes, it opens reason into imagination, by which he forms ideas of relationship between things and things that he never thought of, or would have thought of before. So I say his sense, his understanding, is widened and enriched; he approaches common mechanical work with a superiority to it, and a mental confidence not otherwise obtained; and by such accomplishments he rises above his fellow workmen, he gains in self-respect, and if he has the ability to rise to higher branches of his profession, this study will have given the spring to what otherwise would have been dormant, and will have opened the first development of powers of mind and skill that his future life will profit by and bless. I urge the consideration of such thoughts as these by the workpeople around me—and when I use such a word I mean to include women, girls, and boys in the class whom this school and its quiet steady work will benefit. I urge them to profit by it, and if they would do so let them undertake it with this view, that they come here to clear and enlarge their ideas, to train their conceptions, and to educate their minds by the learning a new language—art's language—that will at once teach them while they learn it, and be to them a fund of resource for the advantage and the happiness of their lives.

The estimation of fine art will always be the gauge of the mind that makes it. Some people look deeply into everything that engages them; others, the greater number, look seriously upon few things, and touch all other things but lightly. So with regard to fine art, some look on it as an amusement, and many as a matter of no use or consequence, or, perhaps, that the world would be better without it. Others look to it merely as a means of livelihood, but have no heart for it; but, having taken up some easy or mechanical branch of it, they pursue it with much the same interest that a lawyer's clerk gives to the deeds and documents that he copies out day after day. The real and worthy estimate of it is far different from these; but in our English life of busy struggle against difficulties of all sorts, that struggle against the whole world that has called out our courage, taxed our resources, and forced our energies to the front, we must be glad that the productions of our finest arts afford any real benefit and satisfaction to our people, be it what it may, high or low. But can any real benefit be an object of low class? As fine art is a result that both soul and body combine to produce, the estimate of it, as high or low, may be rightly made from the inspirations of the intellect downwards to the ingenuity of skill where fine arts merge into useful arts, as, for want of a better word, we classify those which supply the absolute necessities of life. But how hopeless language is when applied to art, how utterly inadequate and misleading is that word! As though what we style "useful" were only true in relation to our bodily state, and in no respect affecting the immortal element of mind and spirit, for which all that can render service and profit is in an infinitely higher sense "useful" than what the present material civilisation, of which the modern age is so proud, can effect; as much higher in its usefulness as mental cultivation is above bodily comfort, luxury, or even existence, as the soul's health is above all the considerations of our mortal state. It is no low estimate of art's "usefulness" when it comes to the relief from the exertions of professional life, domestic anxiety, monotonous labour, uncongenial work, and other causes of mental wear and tear that are common in the world—a relief that comes of entertainment without fatigue, a pleasure that is the best antidote to mental weariness and pain, by turning the flow of thought and feeling into fresh channels, and filling the mirror of the mind with images of interest or happiness or beauty, without demand for further attention or care than each mind may have strength or ability to give to them. Our fine arts are most valuable in this weary world, even if they be regarded in this the lowest estimate of them.

Nor must we throw aside too hastily another form of their benefit to many to whom I referred above as following them without heart or interest, but as a mechanical pursuit for livelihood. These departments of art, such as some subsidiary processes of engraving, of photography, of plan drawing, and of many forms of copying and so forth, can only be brought to perfection by much wider range of study both of eye and hand than what each one singly may require. I mean that elementary, and even in some cases that advanced, art-study that trains the attention, drills the nerves and muscles of the brain and fingers to higher and more difficult work, both of understanding and execution, by which a skill is reached that can be applied with readiness and success to any work that becomes the object of it. Even if our experience or witness of actual life is insufficient, it needs but little stretch of imagination to picture to ourselves realities which, in every class

of our social state, are hidden from the outside world by the tender sense, the refinement, the high principle and self-sacrifice of those who labour on in devotion to parents, friends, and families, crushed by sickness, sorrow, or misfortune, and who, by those high motives of heart and work, support by their unflagging industry (even if it be irksome to them) those from whom all hope and resource has been cut off, and over whose sorrow and distress affection strives to throw a veil. Such are the works, in many departments of fine art, by which many, old and young, to whom nature has denied physical strength for severer employments, can and do occupy themselves—persons of whom the world might well be proud if it did but know them, angelic lives in dreary homes, a living smile where all else is sad, unnoticed, perhaps, but blessed. It is hard to say that art could have a higher object than such a service as this; but it has a far higher sphere of intellectual interest and attainment, entirely apart from the private or individual value of it—a sphere, I mean, of national cultivation, by which a whole people is affected; and whether observed or unobserved by themselves, their interests and pursuits, their work and recreations, are supplied and brightened by the unflagging and beneficent resources which fine art affords to them. In whatever form, under whatever guise, it be followed, whether mentally for its poetry and philosophy, or practically for its ingenuity or its education, it is full of good; but above all for its inexhaustible language, by which the thought, the emotion, the enthusiasm of human hearts find their best expression, their own relief and happiness, and the charm and refreshment of many other lives than their own. Such is but a very slight sketch of a very true picture of what art is or might be; of what it is to many, and might be to all.

### THE PRESENT STATE OF ARCHITECTURE.\*

THE advanced civilisation we live in demands of us a line of action differing somewhat from what has gone before. Almost up to the present century an architect's work has been confined to some one building or set of buildings. In the earliest times the architect was the master builder, and often finished but one piece of work during his career. This has been true until within the last two or three hundred years. It was easy for him, comparatively speaking, to do his work to the satisfaction of his client, and to leave a monument finished in every detail.

To-day a man in active practice is expected to design everything, from a cottage to an ornamental public building. From Bazileel, who was designated by God to erect a tabernacle in the wilderness, down through Phidias and Vitruvius, John of Gloucester, Irvin of Steinbach, and Robert de Beverley, to Michael Angelo, an architect's work has been confined in narrow channels, and it may well be doubted whether these masters could have left a name had they been obliged, as we are, to turn from a temple or palace to a dozen other totally different problems all in one year. The times have changed, and we of to-day are loaded with such emergencies as were unknown to the ancients. This should give courage to him who is dissatisfied with his work. If, in spite of the multiplex problems laid out for him, he succeeds in evolving one satisfactory building, he will have done quite as much as the architect of old. It is of importance to us who make up that latest product of time, the architectural profession of the West, to recognise the great changes which have come over the practice of our business. We ask ourselves why ancient buildings were good. M. Viollet-le-Duc has shown, and I think justly, that the beautiful temple called the Parthenon was the result of constant and minute criticism of entire educated Athens. This shows the law of our nature, working toward a distinct end. Where there is a gathering of men, all intent on one purpose, the result must be the perfect expression of the work of them all.

Society to-day calls on us for a much wider range of thought than was formerly expected of an architect. On account of the condition of our life, we are in a measure cut off from that peculiar help the old architects had from each other. We now principally need the restoration of the spirit of brotherhood which has been lost. We certainly are capable of doing more than those who went before. We have their work before us, both in general and detail. We have photographs of their monuments as a whole, the coloured prints of their interiors, and the scaled measurements of their most delicate parts. We have their writings, with the conclusions of their lives. With all these and our own facilities for perfect intercommunication, which the men of old most sorely lacked, why is it we do so little which is thoroughly satisfactory, even to ourselves?

Haste, resulting from feverish push, is responsible for much. We are asked for complete results in a period which to the ancient would have been too short for his first conception. Were it not for other things, there could be no satisfaction to the mind of an earnest man in doing his work, but in spite of our being so hurried by the rush of modern life, we have a chance to guard ourselves against mistakes if we will but analyse our position. We

\* An address by Mr. D. H. Burnham, delivered at the opening meeting of the Western Association of Architects in Chicago.

all need kindly criticism. No man can be a law unto himself, and the best effort of the brightest intellect must be inferior to what it might be if the designer would submit his work to the scrutiny of others in his profession. We look to this convention to inaugurate an era of good feeling among the architects of the West. Recognising our standing in the advance of civilisation, we feel that combined effort would save to us and to posterity the best thoughts of us all; that working merely as individuals, entertaining a narrow, jealous disposition towards others, we cut ourselves off from those corrections which are absolutely essential to prevent such glaring flaws as inevitably come from haste.

It is not intended to claim extra brilliancy of intellect or warmth of heart to us of the West, but the conditions which invariably produced perfect styles in the past are now once more active among us. What made the architecture of Athens? I have quoted from a celebrated French author to show that the results came from freely-expressed criticism of the populace, but this itself arose out of what was far more potent. Athens was a commercial city; to it came men of all nations; at its port were seen the dresses of all tribes, and there were heard the tongues of the civilised world. From the very nature of things the Athenians were the brightest spirits of the times, and probably the best informed men then on the globe. The restless activity of their minds and their adventurous feelings had brought them from far divergent lands; they were animated to overcome all difficulties, to seek the great commercial cities of their day. The city was filled with individuals from the various countries around the Mediterranean, who were well posted on science, art and manufactures. Picture to yourself a humdrum countryman in Athens for a day or two. Must he not have been astonished at the quickness of mind of all about him—at the extent and precision of knowledge among sailors, soldiers, merchants and philosophers? Again, a few years later we find a similar set of circumstances producing the same result. Carthage arose like a queen from the sea; her towers and palaces were spoken of by the ancients only in terms of deepest wonderment. Again, Rome rose in all her magnificence, and drew the choicest men and materials from the entire world; rare gems, colours in purple and fine linen, a manuscript of the past; but, above all, in her streets were found the sublimed Greek, the Gaul of scientific turn, and the sweetest poets of all countries.

To-day we have this conglomeration of men who make up our great West. More than the Athenians, the Carthaginians, or the Romans, do we feel a spirit of enterprise; in a greater degree do we draw to our centres the thinkers of all countries. Here come determined, bold spirits, who, filled with ambitious dreams, have left their older homes in Germany, France, Italy, England, in the Orient, and in the older states of our own country, all imbued with the same restless activity, the same readiness to give up the old when the new is better, the same fearless examination of everything laid before them.

We are, without doubt, all, in a certain sense, adventurers. Each man brings some knowledge peculiar to the land of his birth. Each one has the disposition to look upon things in accordance with the nature of his blood and the education of his province, and the community as a whole is thus constantly enriched with the thought of this steady stream of keen, incisive, thoroughly living men.

If we recognise this fact, and all of us determine to make the most of it, we must show a progress that will surpass anything which has gone before. In short, we possess the whole past in a living form, ready to actively assist each and all of us in the struggle to eliminate crudities and to secure what is in accordance with the unchanging laws. No man among us can possibly possess more than a fragment of the knowledge of all, and if we would do the best with our lives we must do the best for the community and the times we live in. This can be brought about by each one acknowledging his shortcomings and being willing to frankly and kindly accept the help of others, and, still more, to give it in the same spirit himself. If there is a man amongst us who has an ambition to leave an honourable name—and I hope this is true of every individual—he may be sure he will fail of his object if he works for himself alone. There are many things, undoubtedly, which will come up for discussion in the convention, which are peculiarly its province. I will, therefore, only mention a few, as, for instance, the schedule of fees, the code of professional ethics, and that frequent source of trouble—competitions. Remember that our science is a union of all sciences, and this to a degree that cannot be said of any other profession, and that the great man is both a theorist and at the same time thoroughly practical; that we should be ingenious and apt to learn.

Recognising this, it is hoped that an impetus will be given here which will carry us on to success and make our work better. It is not to be hoped, perhaps, that the name of each shall go down to posterity, but it may be hoped that the united efforts of us all will leave impressions which shall stamp a pure American spirit on the ages to follow.

Shall we teach the lesson of united effort in an honest, manly cause? The famous scientist whose philosophy crowns the thought of this century said, in his few words of warning to Americans, "The duration of your institutions will depend, not on your

education, but upon your character." Does not every one of us see that it is so, and hope with Spencer that the blood of our hearts may warm us toward the common good, and the thought of our brains be toward the accomplishment of our work as a whole, and not primarily toward the fleeting success of the individual, be it in finances or in popularity.

## MEASUREMENT OF TIMBER.

A TEST case was heard in the Queen's Bench Division, before Mr. Justice Grove and Mr. Justice A. L. Smith, on the 19th inst., which concerns the timber trade. It was an appeal by the Great Western Railway Company from a decision of the County Court Judge at Dudley. The sum claimed was 4*l.* 10*s.*, being the balance of an account for the carriage of timber in the form of trees with the bark on carried by the plaintiffs on their line for the defendants from Moreton-in-the-Marsh to Withymoor. The sum sued for is the difference between the charge which the plaintiffs are entitled to if the tonnage of the trees is to be ascertained according to what is known as "tape measurement," and what they are entitled to if such tonnage is to be ascertained according to what is known as "string measurement." The plaintiffs claimed on the former, and the defendants had paid them all on the latter. The Act of Parliament under the 119th section of which the plaintiffs are entitled to charge 2*d.* a mile per ton for the carriage of timber is a private Act (8 and 9 Vict., c. 184), the words as to the weight being "Forty cubic feet of oak, mahogany, teak, beech, or ash, and fifty feet of any other timber shall be deemed one ton, and so on in proportion for any smaller quantity." The difference between tape and string measurement arises from the mode of ascertaining the quarter girth at any given point, from which, when once ascertained, the cubic contents are calculated on the same principle and from the same table in both cases. In tape measurement the entire girth is measured with a measuring tape over the bark, and then divided by four to get the quarter girth. In string measurement string or pack thread is used and drawn tight round the tree; the string is then twice doubled, then measured so doubled along a rule, and when the bark is on the tree a deduction is made for it of half an inch in the case of trees less than 12 inches entire girth and 1 inch per foot in larger trees, and the remainder is the quarter girth. The quarter girth arrived at by string measure is less than by tape measure, because (1) the string, being thinner than a flat tape, is found in practice to fall between the rough edges of the bark and run closer to the solid wood, and the entire girth is thus less; (2) in doubling the string twice before measuring it, instead of measuring the full length, something is lost; (3) deduction is made, as above stated, for bark in the case of trees measured (as all but oak trees are) with the bark on. The actual weight carried is not ascertained; but, as a fact, it generally exceeds the measurement tonnage, whichever way ascertained, and sometimes very largely—in fact, by 8 cwt. or 10 cwt. when string measurement is used, in which case, too, the railway companies get no additional freight for carrying the bark. String measurement is and always has been the usual mode of measurement in England as between buyer and seller, and the defendants contended that at the time of the passing of the plaintiffs' private Act (1845) it was the usual mode of measurement of trees in the round for all purposes. There was no evidence in the case, as found by Sir Rupert Kettle, the County Court Judge at Dudley, as to when tape measurement was first introduced, but it was undoubtedly introduced by the railway companies, and the plaintiffs contended that they were entitled to charge according to it, as being the more accurate and the proper method as between consignor and carrier. The defendants' contention was that "string measurement" was the proper method as between consignor and carrier as well as between buyer and seller, and that the words of the Act must be construed according to the custom of timber measurement in common use in England at the time of such Act having been passed. The County Court Judge decided that the plaintiffs were only entitled to charge for tonnage according to string measurement, and against that decision the railway company appealed.

Mr. Justice Grove, in giving judgment for the respondents, said the case involved nice points which he could not say were wholly free from difficulty. Still, he had arrived at the conclusion that of the two systems of measuring timber, that by string was *prima facie* certainly the more accurate mode. It was not found as a fact in the case that the string would be liable to stretch while round the tree and contract when it came to be measured; and the Court could, therefore, not take judicial notice of that, if it were really the fact. Neither the measurement by tape nor that by string would give perfectly accurate results owing to the rugosities of the bark, but it was not for the Court to suggest a more accurate method of measurement. All that the Court had to do was to say by which of the two methods—by tape or by string—the more accurate measurement of a given bulk of timber would be obtained; of the cubic contents of the trees and not of their weight in tons. The allowance of half an inch for the bark must

be held to be reasonable, and the string measurement to be that by which their bulk would be more accurately ascertained.

Mr. Justice A. L. Smith, in concurring, said the words to be "deemed to be a ton" showed that the intention of the Legislature was that it was on the cubic measurement and not on the weight of the trees that the carriage was to be charged. From the shorthand-note, which was incorporated in the case, it appeared that one of the witnesses for the defendants, who was the secretary of the association of English timber merchants, had given evidence that for nearly forty years timber had been customarily measured by string and with the bark on, and the timber trade had known nothing of tape measurements, introduced, as he believed, by railway companies, until but a short time ago. He was inclined to go further than his brother (Mr. Justice Grove), and hold that the cubic contents of the timber must be ascertained by the railway company according to the mode of measurement which had prevailed in 1845. The measurement by string, going as this did closer to the wood, gave more accurately the number of cubic feet, and, in his opinion, the decision of the County Court Judge had been right, because the "string" measurement was in accordance with the customary mode of arriving at the 40 cubic feet in a tree in 1845, and because, too, that mode was more accurate than measurement by tape.

Mr. Justice Grove said he must not be taken to differ on the question of string measurement being obligatory on the railway company, because it had been the customary mode in England in 1845. His view was that the other ground on which the appeal was dismissed was the stronger one.

The appeal was consequently dismissed with costs; but leave to appeal against this decision was granted.

### AN INDUSTRIAL EXPERIMENT.

THE following account of an experiment in industrial remuneration is narrated by Mr. Broadhurst, M.P.:—For more than four years the Parliamentary Committee of the Trade Unions Congress have continually censured their secretary on the dilapidated condition of their offices; for four years the secretary had successfully evaded the terrible visitation of painters, paperhangers, and bricklayers, but, like many other deferred debts, it had to be met; and after the horrors of an autumn session of Parliament, the additional punishment of cleaning up was comparatively a light one. So I summoned to my aid the general secretary of the Amalgamated Society of the House Painters and Decorators, and, after the usual consultations and measurements, we came to terms, and the work was commenced.

There are five men engaged in the work, one of the number acting as foreman and responsible man, and representing, as far as I am concerned, the employer. He undertakes the whole job for a certain sum of money; each workman will draw his regular trade wages while he is engaged in it, and whatever surplus remains when the work is done will be equally divided among the whole of the men employed. In addition to the ordinary work of the painter and decorator, there were new stoves to be set, new gas fittings to be made, and some joiner's work to be done. The chief of the painters undertook all this work, which in turn was given to the respective trades, and done on the same terms and in the same manner as the painting and decorating. I will undertake to say that the material is of the best quality and that the workmanship cannot be beaten by any nationality known to man. This means not only the natural enjoyment to the occupants of the rooms which is a consequence of the best work, no matter what the work may be, but also prevents the recurrence of this unpleasant visitation for a considerable number of years. All articles of value remain in their places during the repairs, because I know they are safe, and I know they are safe because each workman is a member of his respective trade union. If any further guarantee was necessary, I have it in the very solid position of the trade unions themselves.

Thus, in a small way, the consumer and the producer are brought hand to hand. I, as the representative of the Trade Unions Congress Parliamentary Committee—that is the consumer—having the offices renovated in the most substantial and expeditious manner; they, representing the producer, having a pleasant engagement; and should there be any profit, they will reap the advantages of it. I am fully aware that this is altogether a small and, may be, an insignificant affair; but that has mostly been the position of the present big and substantial affairs of the world. I would rather be the author of this insignificant but practical result than sit in council for a week attempting to manufacture "Aladdin's lamps." I cannot help thinking that there must be a great number of real friends of labour who would be quite willing to engage this little band of men for similar purposes if they only knew how and when they could get them. If I am right in this good opinion of some parts of the human family resident in this great Babylon, I should be most happy to answer any communication on the subject.

There are only two conditions asked of customers—first, payment immediately upon completion of work; secondly, low-price

work is not undertaken. In return for this the householder will get thorough work of the highest quality and the best material the market offers. In addition to this I will answer for the character of the men both as to skill, expedition, sobriety, and civility. Will some of our well-wishers give the suggestion a trial? When the work is complete it will be gladly shown to any *bond fide* visitor to the rooms at 19 Buckingham Street, Strand, W.C. I wish it to be distinctly understood that the men to whom I have referred combine with the ordinary house-painting the very best decorative workmanship.

### LINCOLN CATHEDRAL.

AN address was delivered lately by the Rev. Precentor Venables on "Lincoln Minster." It may surprise some of my hearers, said the lecturer, to be told that Lincoln Cathedral is amongst the younger cathedrals of England. It is true, that its juvenility is not excessive. It numbers eight centuries, which is certainly a very respectable age. But other cathedrals, not the *buildings* but the *sees*, are much older. Canterbury, and York, and London, and Winchester, and others, are twelve hundred or thirteen hundred years old, and might at the period of its foundation look down upon Lincoln as a younger sister. Lincoln, however, though of comparatively recent foundation, is the representative of two very ancient English sees—that of the men of Lindsey, founded after their conversion by Paulinus of York in 678, the seat of which was probably at Stow, the church of that little village being its cathedral church; and that of the Middle Angles, the seat of which was placed at Leicester in 680, which was occasionally held by Bishops of Lichfield. The savage inroads of the Pagan Danes, who mercilessly stamped out Christianity wherever they mastered the country, blotted out the bishopric of Lindsey—it is said the reddened walls of Stow church still tell of the fire kindled by the Pagans—and drove the bishops of Mercia further inland. They took up their *Cathedra*—the Bishop's stool, our Anglo-Saxon forefathers called it—and, retreating to the banks of the Thames, planted it at Dorchester, not far from Oxford. The church of this place then became the cathedral church of Mid-England, from the Humber to the Thames, a vast stretch of country, including no fewer than ten counties, those of Lincoln, Northampton, Rutland, Leicester, Cambridge, Huntingdon, Bedford, Buckingham, Oxford, and Hertford, and continued such till after the Norman conquest, when, by the license of the Conqueror, the see was transferred to Lincoln. The removal was brought about in the following manner. When William the Conqueror, then only Duke of Normandy, was preparing for his invasion of England, a monk, by name Remy (in Latin Remigius), was almoner of the Norman monastery of Fécamp. He contributed to William's expedition one ship carrying twenty fighting men. The grateful invader promised that if he became master of England the first vacant bishopric should be Remy's reward. The opportune death of Wulfwig, Bishop of Dorchester, the year after the Conquest, enabled William to make good his promise. The Norman monk became bishop of the largest and most powerful see in England. The personality of Remigius is very distinct. Almost dwarfed in stature, dark of complexion, undignified in aspect, "nature," says Malmesbury, "seemed to have formed him to show that the richest intellect might dwell in the most wretched body." But though "small of stature he was great in soul, though dusky of hue he was fair in his works." For one of the chief of those works we of Lincoln have cause to remember him with gratitude. For Remigius was the first founder of our cathedral. The era of the Norman Conquest was marked by the transference of cathedral churches from unwalled villages, open to the attack of the marauder, to walled towns. Before the Council of London, which in 1075 issued an edict to that effect, Remigius, accustomed to the lordly cathedrals of the Norman cities, looking with contempt on the humble episcopal see of Dorchester, on the very southern edge of his vast diocese, had resolved to remove his bishop's stool to some worthier and more central site. We of Lincoln shall not wonder that of all the towns in the ten counties subject to his episcopal sway none appeared so fitting as Lincoln. Hither, then, he transferred his see, and on the crest of the hill, looking down on the broad valley of the Witham, hard by the castle "already rising to curb the haughty burghers" of our "wealthy and famous" city, on a site already consecrated in part by the old church of St. Mary Magdalene, he reared his cathedral, "strong as the place was strong, fair as the place was fair," as acceptable to the servants of God who were to minister in it as it would be secure from the attacks of all enemies. Commencing the vast work soon after the removal of the see, about 1074, the church was ready for consecration in 1092. But the founder was not allowed to witness the solemn dedication of his cathedral. May 9 was fixed for the rite; all the bishops of England were bidden by royal order to come together to take part in it; but "man proposes and God disposes." One of the episcopal body, Robert of Hereford, foreseeing from the conjunction of the stars—for he was a skilful astrologist—that the consecration would not take place, stayed at home. The others came, together with a vast crowd of men of all ranks; but three days before the appointed time Remigius was no more.

Remigius's church, as far as we can gather from the fragments left to us, must have been an uncompromising example of the Norman style, just introduced by the conquerors, in its sternest simplicity. The walls bare, unrelieved by ornament; the sharp edges of the semicircular arches without even chamfer, much less a moulding; the windows were round-headed apertures. The austere fabric would have found little favour in our eyes, and while we rejoice that enough has been preserved to show us what it was, we may well congratulate ourselves that it has generally been replaced by something so much more beautiful. It grew year by year and century by century, grew in size, in dignity, in beauty, in fitness for its high purpose, until its arched vaults and soaring pillars, its mazy aisles and long perspective, its long roof and triple coronal of towers, attained the unrivalled majesty and beauty which is our daily glory and our pride.

Remigius's successor, Robert Bloet, is not recorded to have built anything at Lincoln, but to his successor Alexander—"surnamed The Magnificent," from the sumptuousness of his equipage and the lavishness of his expenditure—did much. The nephew of Roger, of Salisbury, in his time the most powerful man in the kingdom, like his uncle, he was, in his early days, far more of a castle builder than a church builder. The fortresses of Banbury, Sleaford, and Newark rose at his command. But they were his ruin. He and his uncle and his cousin, Nigel, of Ely, were too strong to be safe subjects. A pretext of a brawl, raised by their retainers, at Oxford, was eagerly caught by King Stephen. The Bishops were seized, and by the threat of starvation, which was actually begun to be carried into effect, Alexander was compelled to give up his castles into the king's hands. This was in 1139. Two years later, in 1141, the cathedral suffered from a disastrous fire, which burnt off the roof and destroyed the flat ceiling of timber. To obviate the recurrence of such a calamity, Alexander vaulted the whole church with stone, and repaired the church "with such subtle artifice" that "it looked fairer than in its first newness." To the same magnificent prelate we may safely assign the three magnificent western doorways and the lower portions of the western towers with their elaborately ornamented gables. With these additions and alterations the fabric of the cathedral remained as Remigius left it.

Some forty years after the completion of Alexander's works England was visited with the shock of an earthquake (such as that felt at Colchester not many months ago), which threw down many buildings and rent our cathedral from top to bottom. This was on April 15, 1185. The next year saw the election of one of the holiest and most devoted of the prelates, who have adorned this see by their virtues—the Carthusian monk and prior, the son of a Burgundian noble—the sainted Hugh of Avalon, an upright, honest, fearless man, an earnest, loving Christian bishop, than whom in the whole range of English worthies, lay or clerical, few deserve a higher place. Finding the cathedral in ruins, he at once resolved to commence its re-edification. Some time elapsed in preparing the designs and collecting the materials for so great a work, and the first stone was not laid till 1192, the third year of Richard Cœur de Lion. The architect's name, by an unusual good chance, has been preserved, and was Geoffrey of Noyers. The style adopted was the pure Early English, a lancet Gothic which had just been developed from the stern old Norman or Romanesque, of which the choir and eastern transept of our cathedral afford the earliest known example. Bishop Hugh not only furnished the funds for the work and gave it the benefit of his own personal oversight, but from time to time helped it on with his own labour, shouldering the hod and carrying the cut stones and mortar for the use of the builders. But, like Remigius, he was not allowed to witness the consummation of his work. He died in 1200, having seen the completion only of the choir and eastern transepts and the commencement of the great transept.

The work was carried on continuously, though we have no documentary records of the progress of the work by his successors, William of Blois and Hugh of Wells, brother of Jocelin, bishop of Bath and Wells, who at the same time was building the cathedral of Wells. During the six-and-twenty years of the episcopate of this second Hugh (d. 1235) the nave and side aisles must have been built, the Galilee porch, chapter-house and vestry erected, and preparations made for the completion of the west front. This work consisted in the encasing and heightening of the stern Norman work of Remigius, niche-arcaded walls of the Early English style, the patent unreality of the upper portion of which—"a mere mask without the slightest honest expression"—may be forgiven for its wondrous beauty, and the skill with which the acknowledged difficulty of continuing work of various ages in one design was met and overcome. This work may be ascribed to the episcopate of Robert Grosstête, the peasant's son. It was during the episcopate of this great and good man that the central tower was rebuilt after its fall. The latest portion of the fabric of our minster—the unrivalled angel choir—was added between the years 1255 and 1281, in which latter year the wonder-working relics of the then canonised Hugh of Avalon were translated with great pomp, Edward I., Queen Eleanor, their royal children and many of the noblest and greatest in Church and State, attending the ceremony, to a shrine behind the reredos in this newly erected portion of the church, destined for its reception.

The cloisters, a beautiful example of the Decorated style, were added in the episcopate of Oliver Sutton, 1296; the upper part of the broad tower was raised under Bishop John of Dalderby, between 1307 and 1311; the west windows were put in and the western towers elevated by Treasurer John of Welbourne, who also gave the design for the choir stalls (1350-80 or very soon afterwards), and the work, as we see it, was fully completed by the addition of the charming little chantry chapels of Bishop Fleming (d. 1431), Bishop Russell, the chancellor of Edward IV., and the tutor of his ill-fated little son, Edward V. (d. 1493), and Bishop Longland (d. 1547). Defaced by the religious zeal, not always according to knowledge, of the Reformation; sacked by the Parliamentary soldiers in 1644; only rescued from threatened destruction by the civic worthy, Mr. Original Peart, Mayor in 1650, and M.P. in 1654-56, who represented to Cromwell that "if the minster were down Lincoln would soon be one of the worst towns in the country;" restored according to their lights by Bishop Fuller and Dean Honeywood, after the restoration of Monarch and Church—it has been reserved to the last and present year to disinter the buried fabric, to throw down the imprisoning palisade, and to exhibit its matchless proportions in their true beauty and dignity.

## THE CITY COMPANIES.

### 6. The Plumbers' Company.

THAT the Plumbers' Company had existence as a body from a very early period is shown by ordinances passed in the thirty-eighth year of the reign of King Edward III., 1365, of which the following is a translation:—

May it please the honourable men and wise, the Mayor, Recorder, and Aldermen of the City of London, to grant unto the plumbers of the same city the points that here follow:—

In the first place, that no one of the trade of plumbers shall meddle with works touching such trade within the said city, or take house or apprentices, or other workmen, in the same, if he be not free of the city; and that, by assent of the best and most skilled men in the said trade, testifying that he knows how well and lawfully to work, and to do his work; that so the said trade may not be scandalized, or the commonalty damaged and deceived, by folks who do not know their trade.

Also, that no one of the said trade shall take an apprentice for less than seven years; and that he shall have him enrolled within the first year, and at the end of his term shall make him take up his freedom, according to the usage of the said city.

Also, that every one of the trade shall do his work well and lawfully, and shall use lawful weights, as well in selling as in buying, without any deceit or evil intent against any one; and that for working a clove of lead for gutters, or for roofs of houses, he shall only take one halfpenny; and for working a clove for furnaces, *tappetroughes*, belfreys, and conduit pipes, one penny; and for the waste of a wey of lead when newly molten [he shall have an allowance of two cloves], as has been the usage heretofore.

Also, that no one for singular profit shall engross lead coming to the said city for sale, to the damage of the commonalty; but that all persons of the said trade, as well poor as rich, who may wish, shall be partners therein at their desire. And that no one, himself or by another, shall buy old lead that is on sale, or shall be, within the said city or without, to sell it again to the folks of the said trade, and enhance the price of lead, to the damage of all the commonalty.

Also, that no one of the said trade shall buy stripped lead of the assistants to tilers, *lagers*, or masons, or of women who cannot find warranty for the same. And if any shall do so, himself or by his servants, or if any one of them be found stealing lead, tin, or nails, in the place where he works, he shall be ousted from the said trade for ever, at the will and ordinance of the good folks of such trade.

Also, that no one of the said trade shall oust another from his work undertaken or begun, or shall take away his customers or his employers to his damage, by enticement through carpenters, masons, tilers, or other persons, as he would answer for the damage so inflicted, by good consideration of the masters of the said trade.

And if anyone shall be found guilty under any one of the Articles aforesaid, let him pay to the Chamber of the Guildhall, in London, for the first offence, 40 pence; for the second, half a mark; for the third, 20 shillings; and for the fourth, 10 pounds, or else forswear the trade.

It is believed that the only charter in existence relating to the company is one which was granted by King James I. in 1611. By it they were granted and declared to be for ever one body, corporate and politic, in deed, fact, and name, by the name of the "Master, Wardens, and Commonalty of the Freemen of the Mystery of Plumbing of the City of London," for the better ordering, rule, and government of the men of the mystery and company, and of all those who then exercised and used, or thereafter should exercise and use, the art and mystery of plumbing or the materials, works, merchandises, or things whatsoever to the said mystery relating, and for the utility, advantage, and relief of the good and honest, and for the terror and correction of the evil, deceitful, and dishonest.

The objects of the company, as set forth in the charter, may be generally stated to be to exercise a supervision of the interests and practice of the art and mystery of plumbing in the City of London and its suburbs, and the City of Westminster and its suburbs, and within three miles' compass thereof; to secure good workmanship

and the employment of the best materials in the trade, and to enforce the use of proper weights and measures in transactions of commerce. In the course of time, and by the effect of legislative changes, and substitution of iron and other metals for lead in the manufacture of weights and measures, the exercise of these functions may be said to have fallen into desuetude; but, with this limited exception, the company have always devoted their best energies to discharge the other and far more important duties devolving upon them by the charter—*i.e.* regulating the price of lead, the purity and commercial value of the solder, the character of workman employed in this important branch of the building trade, and the binding of apprentices.

The progress of sanitary service has demonstrated the important relations which the art of plumbing holds to the health, comfort, and social elevation of the people, and members of the company have accordingly taken a part in the efforts to promote technical education. In 1875 a committee was appointed "to inquire into and report how far technical education can be promoted among the workmen of the trade, and to ascertain the mode or modes by which it can be best attained. The following are among the conclusions of the committee:—

Our opinion is that any attempt on the part of the company to interfere with the workmen's societies or clubs will fail. No inducement which can be offered them will influence them to alter their rules, and unless these rules are altered we fear the company's efforts will be of very little use, and that the next thing to be considered is what is to be done in support of the apprenticeship system; that which at present exists is a system not only detrimental to the trade, but inasmuch as good plumbers' work in any building, whether public or private, is most essential to the comfort and health of the occupants, and indeed ultimately touches the question of public health, we are of opinion that it is desirable that an effort should be made to secure as far as possible a supply of properly-trained workmen.

For years past in London the apprenticeship system may be said to have fallen into desuetude, and instead of which labourers who, after having attended for two or three years on a plumber, get to know what they think enough of the trade, and just enough to impose upon those who know less. This class of labourers get employment by many builders to do work beyond their capacity, hence the many complaints of bad plumbers' work, not only in houses run up by speculative builders, but also those of a much better class, and unless something be done to check this the public health will drift into a very bad state. The real question being, How is this state of things to be altered or modified? We confess that the difficulties appear, if not insurmountable, such as require the most careful consideration.

Since that time the Plumbers' Company have directly co-operated with the City Guilds Institute, and have agreed to make an annual grant in its support, and have obtained a recognised place for plumbing among the industries which "the Institute" is designed to promote. An annual grant of 50*l.* out of the limited revenue of the company has also been made to the Institute.

The present number of freemen is believed to be about fifty, and the number of the livery is fifty. The qualification for membership is birthright, or apprenticeship, or purchase. Women are eligible. The fees payable for admission by patrimony, service, or act of Common Council, are 30*l.* 6*s.*; by redemption through apprenticeship, 13*l.* 8*s.* 6*d.*; and by ordinary redemption, 23*l.* 8*s.* 6*d.* The admissions of late years have been as follows:—1870, one by patrimony; 1871, nil; 1872, fourteen by redemption and two by patrimony; 1873, two by redemption; 1874, three by redemption; 1875, eight by redemption and one by servitude; 1876, two by redemption and two by patrimony; 1877, nil; 1878, two by redemption; 1879, nil; 1880, nil. In the ten years from 1870 to 1880 only four apprentices have been bound to members of the company.

The advantages incident to the position of a freeman were to enable him to carry on his art and mystery as a plumber within the City of London and the City of Westminster and the suburbs and liberties thereof, and within seven miles' compass thereof, without which he could not carry out such privilege, and when in adversity he is eligible to receive pecuniary aid, to be obtained either in a single amount, or spread over a term of quarterly payments or otherwise, as may appear most suitable to the governing body. This privilege extends to his widow and family. As a liveryman, the advantages are to vote for election of members of Parliament, and the further right of voting at all elections for the lord mayor and sheriffs of the City of London and Middlesex, and the officers thereof, namely, the chamberlain, the bridge masters, and of attending to record their opinions and votes at every common hall. Those of the master, wardens or other members of the governing body are precisely similar to those of the livery.

#### 7. The Tylers and Bricklayers' Company.

The origin of the Tylers and Bricklayers' Company, which ranks the thirty-seventh in the order of precedence, was in the necessity of providing some authority to which persons connected with the trade of tylers and bricklayers might resort for the better government, as regarded manufacture and work, apprenticeship, meeting of members, and the succour of those in old age and distress. The fellowship was governed and represented by the governing body of the company, who were called "the master and

custodes" or "warden of the fellowship," and who had been in the habit, time out of mind, of making divers ancient rules, ordinances, and orders for the conservation, rule, good order, and government of the "fellowship."

A charter of Queen Elizabeth, dated August 3, 1568, gave the master and wardens certain rights and privileges. Another charter, dated July 14, 1571, gave the master and wardens power to search and view bricks, tiles, and the materials whereof they are made, and to fine makers and holders of bad and imperfect bricks, tiles, and materials and work. This charter contains provisions as to the taking of apprentices, keeping order among the craft, powers to have a beadle—a clerk—to recover penalties, to appease controversies, to keep courts. It also contains provisions as to the several oaths to be taken by members of the company.

A charter of James I., dated April 20, 1604, incorporates the members of the company, gives them perpetual succession, with power to plead, to have a common seal, to choose a master and two wardens, to hold land, make rules and ordinances for the government of the company, to levy fines, to admit and expel members, to govern the freemen, and to punish for bad work and materials. This charter is dated from Gorambray.

A charter of James II., dated February 18, 1685, incorporates the company, gives perpetual succession, with power to have, purchase, receive, and possess land and goods and chattels, with power to plead, to have a common seal, to have master and warden, assistants and clerk; to have a common hall, to hold courts. The charter also contains provisions as to the mode of appointing the master, wardens, assistants, and other officers, also power to make by-laws, and to set and recover fines. It also contains provisions as to the binding of apprentices.

By the charters and ordinances the right is vested in the company exercising certain superintendence over and encouragement of the trades of bricklaying, brickmaking, and tiling. The local limit is London and fifteen miles around. The rights of search and condemnation of goods and of fine are not now exercised by the company, but the company continues to encourage and promote the well-being of its trade by means of the apprenticeship system, and also by bringing together men engaged in the trade, and by looking after its poor.

There are about ninety freemen, and seventy-eight liverymen. About forty members of the livery are connected with the building trade; most of the others are descended from persons connected with the trade. The qualifications for freedom are:—(a) Having been born free (patrimony). (b) Having served the usual seven years' apprenticeship to a freeman of the company (servitude). (c) By redemption or purchase. Women are admitted to the freedom. The fees payable to the company are:—(a) and (b) Patrimony and servitude, 2*l.* 2*s.* (c) Redemption, 21*l.* The qualification for livery is freedom. The fees payable to the company amount to 15*l.* Between 1870 and 1880 there have been two admissions to the freedom of the company through servitude, twenty-one through patrimony, and thirty-four through redemption. The admissions to the livery in the same period have been forty-nine. Since 1877 twelve boys have been bound apprentices by the Court to persons following the trade of bricklayers.

#### TIMBER SUPPLY.

A PAPER on "Past, Present, and Future Sources of the Timber Supplies of Great Britain" was read by Mr. P. L. Simmonds at a meeting of the Society of Arts on the 17th inst. The paper was one of those rewarded by the Committee of the Edinburgh Forestry Exhibition.

Mr. Simmonds said that the immense importance of the extraneous supply of wood to this country is proved by the magnitude of our imports as shown in the Board of Trade returns for the last two years. These exceeded 18,000,000*l.* in value, to say nothing of our home supply of wood. But there are other forest products imported of considerable value, which brings up the total value of forest products to over 31,500,000*l.*

Great Britain, in proportion to its size, is, perhaps, the largest consumer of wood in the world, and her demands are continually on the increase. In 1858, we received about 3,400,000 loads of foreign and colonial wood, of all kinds; last year (1883) we imported over 6,640,000 loads, or nearly double the quantity of a quarter of a century ago. Although the value of the forest products of the United Kingdom are said to exceed 3,000,000*l.* in value, yet our imports of wood are to nearly six times that amount—*viz.*, 17,742,660*l.* in 1883. In 1844, the whole quantity of timber imported into the United Kingdom was under 1,500,000 loads or tons, and the proportions of supply were one-third from foreign countries, and two-thirds from our Colonies. In 1854, the imports were just upon 2,500,000 loads, of which three-fifths came from our own possessions, and two-fifths from foreign countries. In 1883, out of 6,647,211 loads imported, only a little over 1,529,000 loads came from India and our Colonies.

We are living on a capital which is vanishing rapidly, and we certainly look with inquietude upon the prospects of the future. In Europe, Norway and Sweden have more than 177,000,000

acres covered with trees, mostly, however, of the common kinds as spruce, fir, pine, &c., and it is but lately that measures have been taken to replace the fellings near the ports, which have become bare of vegetation; it will take time to reap the benefits of this precaution. The total home consumption of Norway was estimated by Mr. Forest-master Scheen in 1884 at 11,481,000 cubic metres. The annual export of timber in the ten years ending 1882 averaged 900,000 tons. In 1881, the exports of timber from the Crown forests of Sweden reached a value of 1,506,883 kronors (80,382*l.*), the largest sum ever reached. The public and private forests amount to about 90,000,000 acres, and fifteen years, it is stated, will see these supplies very materially reduced.

Russia, with her 527,000,000 acres of woodland, exports no more timber than the Scandinavian countries, while no sound system of forestry has yet been attempted, except the recent introduction of a few foreign trees. About 3,000,000 tons of wood are annually consumed in St. Petersburg for firewood. Excepting in the north and north-east, Russia is poorer in forest than the rest of Western Europe. The principal local use of wood in Russia is for house building, for which purpose it is reckoned that 30,000,000 cubic feet are used annually, and these wooden houses must have to be frequently renewed, if the old saying is true that "Russia is burnt down every seven years." Another large employment of timber there is for ship and boat building. It is calculated that about 75,000 vessels of different sorts ply on the inland waters of the empire, of which about one-fourth are annually destroyed, so that about 15,000 must be built in the year to replace them. The value of the wood exported by land and sea in 1882 was 5,598,120*l.*, and that of wood used for fuel was estimated at 13,600,000*l.* Of the total output for 1880, of 2,911,162 cubic fathoms (seven feet), there was set down for timber and firewood about 617,000,000 cubic feet.

In an official report on Russian forests, recently submitted to the Foreign Office, it is stated that about 33 per cent. of the total area of the country may be reckoned to be forest. As compared with this, Austria has 29 per cent. of her area forest; Germany, 26 per cent.; France, 19 per cent.; Italy, 18 per cent.; and Turkey, 14 per cent. The amount of wood delivered from the forests of the Crown in Russia averages 600,000,000 cubic feet yearly. England takes 40 per cent. of the wood exported, and Germany 35 per cent., of which a good deal is in transit for England. Holland takes 10 per cent., and other countries smaller amounts.

Spain and Portugal, with 6,000,000 acres of woodland, contribute but little to the timber trade of the world; while France, with her 22,000,000 acres, can spare no wood, as she needs every bit for home consumption. Germany has 40,000,000 acres of woodland, and better care is taken for the maintenance of forests there than anywhere else, and the greatest quantity of the best European timber is produced there. Italy has about 7,000,000 acres of woodland, and exports excellent timber of the finest quality, but not largely.

Turkey and Greece, notwithstanding they have over 10,000,000 acres under forest cultivation, furnish scarcely any timber to the trade of the world. Switzerland and Belgium require more wood than they can produce. The woods and forests of Portugal cover an area of 650,000 acres, of which 600,000 belong to the State and 50,000 to municipalities; 460,000 acres are covered with pines, and 125,000 with oaks and chestnuts. The largest pine forest is that of Lieria, where the maritime pine abounds. Algeria, with a superficies of 14,000,000 hectares (about 30,000,000 acres), has one-tenth under forests, woods, and coppices.

The Austrian Empire is clothed with forests (some 45,000,000 acres), which annually furnish 17,000,000 of cubic cords of wood of all descriptions. In some provinces the country is almost wholly covered with trees. Unfortunately, the best kinds are yielded by the most mountainous districts, from whence the difficulty and cost of removal is very great. The wooded districts of Austria comprise 31.7 per cent. of the soil, and from the excellent quality of the timber they furnish to industry species the most varied. The average annual export, from 1872 to 1876, was 181,173 cubic metres of firewood, and 1,749,978 of woods of construction. In 1877, 295,452 cubic metres of the former, and 2,660,711 cubic metres of the latter. There are about 9,300 sawmills at work, 217 of these are worked by steam, 38 by steam and water, and 9,000 by hydraulic power. The timber sold and employed in the interior of Hungary has been valued at 2,500,000*l.*, and the quantity exported at about the same, of which half represents the expense of production, transport, &c.

The great importance of North America for the future timber supply of the world may be deduced from the fact that Canada possesses almost 1,000,000,000 acres of timber lands, and the United States nearly as much; while the whole surface of the European forests taken together only amounts to about 800,000,000 acres, or less than half of that of North America. But the United States, judging by the declared value of her exports of timber, cannot be looked upon for any continuous supply, the shipments for some few years past having become almost stationary at a little over 3,000,000*l.* sterling in value.

Nothing need here be said about the timber supply of Africa,

for of the forests of that continent we at present know but little, except the woods obtained from Algeria, the coast districts of Western Africa, and the South African colonies, which are very limited.

The Australian colonies at present contribute but small supplies to Europe, and the local demand for timber as the settlement progresses is increasing rapidly. The forests of the islands of the Eastern Archipelago will be principally utilised by Holland and Spain. British India and the other parts of Asia, however, furnish useful supplies of wood, and will contribute more as the forests are more easily reached by rivers and roads. The South American forests have as yet furnished but little timber to Europe, except small supplies from Mexico, Central America, and British Guiana. The magnificent forests of Brazil, with their large varieties of wood, have yet to be drawn upon, but at present are for the most part inaccessible to the wants of commerce. The only sources from which we draw our present supplies of timber are the Northern States of Europe, and the Dominion of Canada. From the United States and our different colonial possessions we can expect no supplies, or but very limited quantities; and it behoves, therefore, all timber-producing countries to husband their resources, and, by judicious forestry regulations, to prepare increased supplies for the future demands of the world. Dr. Lyons, M.P., who has recently given much attention to this subject, says:—"Other nations are making the remark that, standing prominent as England does as the largest importer of timber, to no other country is the forest problem of such importance. What with timber and the other great forest products, her imports amount in value to 20,000,000*l.* per annum, and it is not too much to say that not alone her maritime supremacy, but her position as a first-class Power in the world, depend on the forest supplies of these products, while her domestic industries would be hopelessly crippled if they were even temporarily suspended."

#### The Dome of St. Paul's.

SIR,—Mr. Armitage's words, which I made no pretence of quoting in my article, are of less significance than the fact of his condemnation of "the incubus of Mr. Stevens's design," garnished, indeed (as he recalls to my memory), with the customary compliment, but still a condemnation, and couched in terms which reminded me at least of the black cap.

Mr. Armitage must be allowed to know better than anyone else what he meant to say; but his hearers may also be permitted to believe the evidence of their own senses as to what his language conveyed to their minds.

I am, Sir, yours faithfully,

13 Mecklenburg Square:  
Dec. 20, 1884.

LEWIS F. DAY.

#### LEGAL.

##### Queen's Bench Division.

(Before Mr. JUSTICE MATHEW.)

SCOTT v. THE GREAT AND LITTLE CLIFTON SCHOOL BOARD.  
ARCHITECTS AND SCHOOL BOARDS.

The plaintiff in this case, an architect, sought to recover from the defendants, the School Board of the Great and Little Clifton district, a sum of about 90*l.* for services rendered in preparing plans for and superintending the erection of a school for the defendants. The case was tried before Mr. Justice Mathew, without a jury, at the July Assizes at Carlisle (see *The Architect*), when it was conceded by the defendants that the plaintiff had in fact executed the work, orders for which had been given him by the Board and had been agreed to by a resolution of the Board duly entered on their minutes; the defendants, however, refused to pay the plaintiff upon the sole ground that his appointment was not under the seal of the Board, and inasmuch as it related to work of above the value of 50*l.* was not binding upon the Board. The case came on upon further consideration on November 22, and was argued at some length, the defendants' counsel resting their case mainly upon the cases on the subject of contracts by corporations from "*Clark v. the Guardians of Cuckfield Union*," reported in 21, *Law Journal*, Queen's Bench, p. 349, down to "*Young v. the Corporation of Leamington*," reported in "*Law Reports*," 8, Appeal Cases, p. 518, in which it had been decided that corporations could avail themselves of a defence similar to that set up in the present case. Mr. Justice Mathew took time to consider his judgment.

His lordship gave judgment in favour of the plaintiff, and said that although it was true that by sec. 30 of 33 & 34 Vict. c. 73,

a School Board was made a body corporate, with perpetual successors and a common seal, yet the same statute contained further provisions with reference to its proceedings, and these would seem to render the cases relied on by the defendants inapplicable; and his lordship said that if it were necessary for the decision in this case he should hesitate to look upon those cases as a safe guide in cases like the present, where the contract was for a purpose incidental to the performance of the duties of the corporate body, such necessity having been evidenced by proof that the corporation had with full knowledge of its terms, and of all the facts, acted upon it, and taken the benefit of the performance. His lordship, however, held that the plaintiff was entitled to recover upon another ground, namely, that afforded by sub-sec. 6 of sec. 30 and rule 7 in the third schedule. By these it was provided that the appointment of any officer of the Board might be made by a minute of the Board signed by the chairman, and countersigned by the clerk of the Board, and that any appointment so made should be as valid as if it were made under the seal of the Board. The plaintiff had been so appointed architect to the Board, and the subsequent orders for the execution of the plans were given by the minutes of the Board properly signed, and his lordship was of opinion the plaintiff's appointment was within the meaning of that section that of an officer of the Board.

### NEW BUILDINGS.

**West Bromwich.**—The new Union Buildings, situate in Hallam Street, West Bromwich, have been formally opened. The total cost of the infirmary building is 12,447*l.* 3*s.* 2*d.* Accommodation is provided for 224 patients of three classes, namely, ordinary sick, 170; contagious cases, 44; and infectious cases, 10. The arrangement of the wards is upon what is known as the "pavilion" system. All the work has been completed for a sum more than 1,000*l.* less than the original estimate, which was 14,000*l.* Mr. William Henman, of Birmingham, prepared the plans, and twenty-two tenders were received for the work, and the lowest, that of Messrs. Stockton & Son, of Oldbury, for 10,800*l.*, was accepted. The contract for the boundary walling, railing, and gates was let to Mr. W. Bennett, of Sedgley, at 958*l.*; and that for the erection of the laundry was let to Mr. William Robinson, of Birmingham, for 3,570*l.*

### SCHOOL BUILDINGS.

**Blackburn.**—Extensions to St. Immanuel's schools, Cherry Tree, were opened on Saturday last by Mr. Alderman Whiteley, Mayor of Blackburn. The work has been carried out from the designs and under the supervision of Mr. James Bertwistle, M.S.A., F.S.I., architect.

**Little Hulton.**—Schools erected in connection with St. Paul's Church, Peel, Little Hulton, have been opened. The school has been built from the designs of Mr. R. Knill Freeman, F.R.I.B.A., of Bolton, and is Gothic in style, faced both internally and externally with patent bricks, and black and white timber framing of an ornamental character has been introduced in the gables and other parts. The schools are in the shape of the letter T, and consist of two large rooms, each 60 feet by 30 feet, one classroom 23 feet by 16 feet, and two rooms, each 21 feet by 14 feet. These latter rooms are separated from the schoolrooms by glazed screens, the screens between the two schools being also glazed and arranged so that they can be thrown together for public meetings. Large porches and lavatories are provided, and also heating cellar, &c. The contractors are Messrs. Coope Bros., of Farnworth. Accommodation is provided for 572 children.

### CHURCH BUILDING AND RESTORATION.

**Felton.**—The chancel of the ancient parish church of St. Michael has been reopened after restoration, carried out under the direction of Mr. Haswell, architect, North Shields. The contractors were Messrs. Dobson, West Thirston, and Mr. Richardson, Felton. The north-east wall has been almost entirely rebuilt, the foundations have been put right, while the whole of the chancel has been raised about 6 feet.

**Leek.**—The Primitive Methodist chapel and schools have been reopened after renovation. Among the improvements there is a vestry, with private stair, which can upon occasion be thrown into the chapel as a kind of small transept. Exclusive of this the total sittings are about 330 in the area, and some seventy more in the gallery. These alterations have been carried out by Messrs. Sugden & Son, architects. The builders were Mr. Herbert Hall, Mr. Wm. Knowles, and Mr. Isaac Heath.

**Wilton.**—A new vestry has been added to Wilton church and other improvements have been made. The vestry has been built by Mr. John Pearse, of Minehead, builder, from the plans and under the superintendence of Mr. Houghton Spencer, architect, of Taunton.

**Liverpool.**—An iron church has been opened, the erection of which was entrusted to and carried out by Messrs. E. F. Blakeley & Co., of 25 Hatton Garden, Liverpool.

### GENERAL.

**Mr. Whistler** is etching a plate of considerable size. The subject is, *One of London's Most Important Highways*. It will be published by Messrs. Dowdeswell.

**Signor Rossi**, the tragedian, has discovered in the Villa Medici at Florence a picture representing *A Prison in Granada*, which is attributed to Velasquez.

**Sir Frederick Leighton** has purchased a water-colour drawing, *The Sailor's Wedding*, by Mr. Hellward.

A Loan Exhibition of fine art, antiquities, and curiosities, promoted in Peterhead for the purpose of aiding the fund for providing better accommodation for the Arbuthnot Museum, has just been opened.

**Art Classes** are to be established at Romford.

**Norman Details**, showing interesting features of the original building, have come to light at Heybridge church, in consequence of stripping the heavy coatings of plaster.

**M. Albert Goupil**, of the late firm of Goupil et Cie, died last week in Paris, at the age of forty-four years.

The Foundation-stone of the Municipal Buildings at Schaerbeek has been laid. The contractors are MM. Mège & Snaps, whose tender amounted to 960,000 francs. The buildings are to be completed within three years.

The Paris Municipal Council have voted 2,000 francs to pay for opening a window in the church of St. Denis, Rue St. Louis-aux-Maraîs, in order that a better light may be thrown on the fresco by Eugène Delacroix.

Messrs. Thomas Lawrence & Sons, of Bracknell, supplied their well-known "B.L.B." rubbers and facing bricks for the whole of the work in Humphries Hall, recently illustrated in *The Architect*.

**Mr. T. J. Bailey** has been appointed successor to Mr. E. R. Robson, as architect to the London School Board. The salary is 600*l.* per annum, rising by annual increments of 100*l.* to a maximum of 900*l.*, and Mr. Bailey's whole time is to be given to the Board.

**Mr. Rhodes**, the borough surveyor, is to prepare designs for a public hall at Gravesend, to seat 1,000 persons.

**Mr. H. Boys**, brickmaker, Walsall, has announced his intention to give 2,000*l.*, conditionally on 7,000*l.* or 8,000*l.* more being raised, to build and endow twenty-one almshouses for the poor of the borough.

A Site has been obtained from Lady Cathcart for a new Roman Catholic chapel and chapter-house on the island of Eriskay, which lies in the Sound between Barra and South Uist. It was upon Eriskay that Prince Charles I. landed.

A Deputation of the Leeds Justices on Saturday visited some of the principal places of amusement in the town. In some instances the means of egress appeared to be quite satisfactory, and in other cases, where the justices found it necessary to make suggestions for increasing public safety, the proprietors expressed readiness to comply with every reasonable requirement.

**Mr. J. Perry** read a paper at the meeting of the York Architectural Association on Thursday evening last week, on "Classic Architecture and its Application to Modern Uses."

A Church is to be built and a new district formed for Scouthed, in the parish of Holy Trinity, Dobcross, Oldham.

The Annual Conversazione of the Bradford Technical College was held on Thursday and the following evenings last week.

The Canterbury Museum Committee held a meeting last week. The Rev. R. N. Gandy remarked that the reading-room accommodation was most inadequate, and what was wanted in Canterbury was that some gentleman should give 40,000*l.* or 50,000*l.* to build a new set of municipal buildings.

A Lake is to be formed in Southwark Park, the estimated cost of which is 2,490*l.*

The Directors of the National Provincial Bank of England (Limited), are about to rebuild their banking premises, at Deal, from the designs of their architect, Mr. Chas. R. Gribble, 11 Dean's Yard, Westminster. Mr. James Trollope, of Lower Walmer, is the contractor for the works.

The Temple Church will henceforth be open to visitors daily, Saturdays excepted, from ten to one o'clock and from two to four o'clock.

The Ruins of the Cour des Comptes, on the Quai d'Orsay, Paris, are to be removed. The site will be appropriated to the new Museum of Decorative Art, which is to be erected by subscriptions and the proceeds of lotteries. After thirty years the museum will revert to the State.

The Lower Thames Valley Main Sewerage Board on Saturday adopted a scheme of Sir Joseph Bazalgette for the disposal of the sewage of the combined district. The scheme proposes the total diversion of the sewage to land at Crossness. There will be pumping stations at Mortlake and Sutton. The cost is estimated at 563,711*l.*, which will be repaid in sixty years by a rate of 8-8*d.* in the pound.

# SUPPLEMENT

TO THE

# ARCHITECT

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, DECEMBER 27, 1884.

### TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.*

*Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Supplement to THE ARCHITECT."*

### NOTICE TO THE PUBLIC.

By the Post Office arrangements THE ARCHITECT can now be sent to any part of the United Kingdom by an affixed Halfpenny stamp; hitherto the postage has very frequently been twopence per copy. The Publisher will be happy to forward, for 20s. per annum, post paid, THE ARCHITECT, to residents in towns and neighbourhoods to which there is no easy access by railway. Terms for the half-year, 10s.

### APPOINTMENTS VACANT.

MANCHESTER SQUARE, LONDON, W.  
Fourteen Medals, including Gold Medal, International Health  
Exhibition, 1884.

**GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.**

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

TESTIMONIALS.  
"9 Victoria Chambers, Westminster, S.W.  
"June 10, 1884.  
"SIR,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it. "Yours, &c.  
"JAMES WEIR, F.R.I.B.A.  
"To Mr. Grundy."  
"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square.  
"February 15, 1884.  
"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.  
"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools in  
course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public.  
"Mr. John Grundy."

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

**BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION** for coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent. more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh, and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use.

A horizontal boiler, 17 ft. 6 in. long, 15 H.P., gave the following results:—

Temperature on Plates .. .. .	186 deg.
Covering .. .. .	94

One ton of coal was saved per week, and, although the fire was raked out every evening 20 lbs. of steam were in the boiler next morning.

The following testimonial refers to this covering:—

Dear Sir.—It may interest you to know that we save exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

**BELL'S ASBESTOS PAINT**, for floors, stairs, and all interior woodwork, to prevent the spread of fire. This paint is especially useful in cotton mills, and in fact in all factories and buildings exposed to risk from fire. It is quite free from poisonous ingredients, and is both easily and cheaply applied. Bell's Asbestos Paint has, on several occasions, done great service in preventing the loss of life and property. The great fire in Buchanan Street, Glasgow, in November last, produced the following testimony to the value of this material:—

Offices of the *Glasgow Herald*, the *Weekly Herald*, and the *Evening Times*,  
Glasgow, Nov. 14th, 1883.

Mr. John Bell,  
Sir.—As one of the means that helped to save our buildings extending from Buchanan Street to Mitchell Street from the recent great fire, I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the *Evening Times* case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of the Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood, thrice coated with Irish Lime, at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

**BELL'S ASBESTOS SASH-LINE CORD** is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire escapes.

## BELL'S ASBESTOS.

The goods of this house are of the highest quality only, and no attempt is made to compete with other Manufacturers by the supply of inferior materials at low prices. All orders must be sent direct to the undermentioned depots, and not through agents or factors.

**BELL'S ASBESTOS AND INDIA-RUBBER WOVEN TAPE AND SHEETING** for making every class of steam and water joint. It can be bent by hand to the form required, without puckering, and is especially useful in making joints of manhole and mudhole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 feet, from  $\frac{1}{4}$ -in. to 3-in. wide, and any thickness from  $\frac{1}{4}$  in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears the trade mark, without which none is genuine. It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at my price, users are recommended to see that every 10-ft. length of the Asbestos Tape purchased by them bears the trade mark.

**BELL'S ASBESTOS CEMENT** for the backing of firegrates and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firegrates and kitchen ranges of private houses. Any labourer accustomed to handle other cements can apply this.

**BELL'S ASBESTOS BOILER PRESERVATIVE**.—This useful mixture, by absorbing the free oxygen that is in the water, entirely checks pitting and corrosion. It also disintegrates incrustation so immediately as to prevent its adhering to the plates. Not only is a great economy of fuel effected by keeping boilers clean, but the risk of having the plates burned is thereby obviated. It has been computed that 1-16th inch thick of incrustation causes a waste of 15 per cent. of coal;  $\frac{1}{4}$  inch thick, 60 per cent.; and  $\frac{1}{2}$  inch, 150 per cent. Thus the Preservative avoids the great risks which are inseparable from scaled plates, lengthens the life of a boiler, and covers its own cost a hundredfold by economy of fuel. It is entirely harmless, and has no injurious action on metals. It can be put into the feed tank or boiler, as may be most convenient. Sold in drums and casks bearing the trade mark, without which none is genuine.

**BELL'S PURE ASBESTOS CLOTH**, for protection against the spread of fire. Iron curtains warp, and in the great emergency of fire will often be immovable. Asbestos cloth, being incorruptible, will remain strong and flexible for an indefinite period, and will stay the progress of a fire and the passage of smoke longer than any other known material. This cloth is also extensively used in Maignen's unequalled water filters, for which a gold medal and diploma of honour were awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

**BELL'S ASBESTOS BLOCK GAS FIRES**.—The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas burner, is fixed at the bottom of the block. After being lighted a short time, both the block and asbestos fuel throw out intense heat.

**BELL'S ASBESTOS FUEL** for gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

**BELL'S SPECIAL LONDON-MADE ASBESTOS MILLBOARD**, for dry steam joints, made of the best Asbestos fibre, is well-known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and  $\frac{1}{2}$  millimetre to 25 millimètres thick. Each sheet bears the Trade Mark.
